^aThe units for these oral slope factors are (mg/kg-d)⁻¹ for nonradionuclides and (Risk/pCi) for radionuclides.

^bThe units for these oral unit risks are L/g.

^cThe units for these inhalation slope factors are (mg/kg-d)⁻¹ for nonradionuclides and (Risk/pCi) for radionuclides.

^dThe units for these inhalation unit risks are m³/g.

(A) Source: Integrated Risk Information System (IRIS)

(B) Source: Health Effects and Environmental Affects Summary Table (HEAST) 1995

(C) Listed as "Dinitrotoluene mixture, 2,4-/2,6-" in IRIS. The value is based on a study using technical grade DNT.

(D) The cancer potency of PCB mixtures is determined using a three-tiered approach that depends on the information available. Criteria for use of the High Risk and Persistence Tier include: food chain exposure; sediment or soil ingestion; dust or aerosol inhalation; dermal exposure if an absorption factor has been applied; any early-life exposure; and the presence of dioxin-like, tumor-promoting, or persistent congeners. This value, 2.00E+00 per (mg/kg)/day, is the upper-bound slope factor for the High Risk and Persistence Tier. The central-estimate slope factor for this tier is 1.00+00 per (mg/kg)/day.

(E) Region 4 has adopted a Toxicity Equivalency Factor (TEF) methodology for carcinogenic polycyclic aromatic hydrocarbons (cPAHs) and dioxins and furans on the Target Compound List as described in Supplemental Guidance from RAGS:Region 4 Bulletins, Human Health Risk Assessment (Interim Guidance) (November 1995). These TEFs are based on the potency of each compound relative to that of benzo(a)pyrene (BaP) and 2,3,7,8-TCDD. The following TEFs were used to convert each PAH concentration to an equivalent concentration of BaP: (1) benzo(a)pyrene, TEF=1.0; (2) benz(a)anthracene, TEF=0.1; (3) benzo(b)fluoranthene, TEF=0.1; (4) benzo(k)fluoranthene, TEF=0.01; (5) chrysene, TEF=0.001; (6) dibenz(a,h)anthracene, TEF=1.0; (7) indeno(1,2,3-cd)pyrene, TEF=0.1. The following TEFs were used to convert each dioxin and furan concentration to an equivalent concentration of TCDD: (1) 2,3,7,8-TCDD, TEF=1.0; (2) 2,3,7,8-PeCDD, TEF=0.5; (3) 2,3,7,8-HxCdd, TEF=0.1; (4) 2,3,7,8-HpCdd, TEF=0.01; (5) OCDD, TEF=0.001; (6) 2,3,7,8-TCDF, TEF=0.1; (7) 1,2,3,7,8-PeCDF, TEF=0.5; (8) 2,3,4,7,8-PeCDF, TEF=0.05; (9) 2,3,7,8-HxCDF, TEF=0.1; (10) 2,3,7,8-HpCDF, TEF=0.01; and (11) OCDF, TEF=0.001.

(F) The Inhalation Slope Factor was calculated from inhalation unit risk as described in Supplemental Guidance from RAGS: Region 4 Bulletins, Human Health Risk Assessment (Interim Guidance) (November 1995).

(G) The Risk Assessment Program has contacted Superfund and been given provisional values which should be used for DOE-ORR projects. This value should be clearly documented as provisional. For other projects, Superfund Health Risk Technical Support Center should be contacted directly (513)569-7300.

(H) Provisional inhalation toxicity values have been developed by the National Center for Environmental Assessment (NCEA). RAGS: Region 4 Bulletins, Human Health Risk Assessment (Interim Guidance) (November 1995).

(I) Lung clearance classification recommended by the International Commission on Radiological Protection (ICRP): Y = Year, W = Week, D = Day, * = Gas.

(J) Codes used for Classification Weight-of-evidence assigned by EPA are as follows:

A=Known human carcinogen.

B1=Probable human carcinogen based on limited human data.

B2=Probable human carcinogen based on animal data. Human data inadequate or limited.

C=Possible human carcinogen.

D=Cannot be classified because of inadequate data.

E=Evidence that analyte is not carcinogenic.

(W) Withdrawn.

NA = No information available

Note: Blank cells indicate that data are not available or are not appropriate.

Notes: Blank cells indicate that data are not available or are not appropriate; NA=information not readily available at this time; RfD=reference dose; CNS=central nervous system; UF=uncertainty factor; the default value for MF (modifying factor) is one (1); and codes used for RfD basis are Inh=inhalation and Or=oral.

A=Source: Integrated Risk Information System (IRIS) 1998.

B=Source: Health Effects and Environmental Affects Summary Table (HEAST) 1995.

C=This value was derived from methodology that is not current with the interim inhalation methodology used by the RfD/RfC Work Group (see HEAST Table 2 for details). Table 2 lists subchronic and chronic non-cancer toxicity values that are found in Agency documents methods that are not currently practiced by the RfD/RfC Work Group. These values are considered to be adequate provisional values for risk assessment purposes at Superfund and RCRA sites, but are subject to being reviewed by the RfD/RfC Work Group and revised when necessary to reflect current work group practices.

D=IRIS no longer separates manganese values for chronic oral RfDs into water and diet RfDs. The chronic oral RfD is now for the total oral intake of manganese. HEAST manganese values remain separated into subchronic oral RfD (water) and subchronic oral RfD (diet). Since it was necessary to keep the RfD categories for both diet and water on the table to list HEAST values, the IRIS chronic oral RfD for water was changed from 5.00E-03 to 1.40E-01 (the new manganese value for total oral intake) and footnoted "m". The oral toxicity values for 'Manganese (Diet)' are to be used for food uses only while the oral toxicity values for 'Manganese (Water)' are to be used for water and soil uses.

E=HEAST concluded that toxicity data were inadequate for calculation of oral RfDs for copper and substituted the current drinking water standard (MCLG) of 1.3 mg/L.

G=This value was withdrawn from IRIS or HEAST. If this chemical is identified as a risk driver, the risk assessor should consult Region 4 Office of Health Assessment personnel. All withdrawn values should be clearly documented when used in any risk assessment activity.

H=The Risk Assessment Program contacted Superfund and has been given provisional values which should be used for DOE-ORR projects. This value should be clearly documented as provisional. For other projects, contact Superfund Health Risk Technical Support Center.

I=Value taken from *EPA Region III Risk-Based Concentration Table* (EPA 1996).

J=Value used based on guidance from the Kentucky Department of Environmental Protection.

K=This entry was formerly listed as Nickel (metallic) with the CAS number 7440-02-0. The chemical name was changed so that it more accurately indicates the chemicals used in the studies from which the values were derived. Several different nickel salts were used, so the listing of one CAS number is not appropriate and has been replaced with the word VARIOUS. The values remain unchanged. Risk Assessment Program assigns these values to Nickel (metallic), although they are no longer listed with that chemical name.

All withdrawn values should be clearly documented when used in any risk assessment activity.

^aThe units for these oral slope factors are (mg/kg-d)⁻¹ for nonradionuclides and (Risk/pCi) for radionuclides. See Table 4.1 for the source of the oral slope factors.

^bThe units for these absorbed dose slope factors are (mg/kg-d)⁻¹ for nonradionuclides. Absorbed cancer slope factors are calculated by dividing the administered cancer slope factor by GI absorption factor; this value is used in the BHHRA to calculate contribution to cancer risk from dermal exposure.

^cThe units for these external exposure slope factors are ((Risk g)/(pCi yr)) for radionuclides.

Note: Blank cells indicate that data are not available or are not appropriate.

Analyte	Oral Reference Dose ^a	GI Absorption Factor	Absorbed Dose Reference Dose ^b (mg/kg-day)
Xylene, m,p-	2.00E+00	0.92	1.84E+00

^aSee Table 4.2 for the source of the administered reference dose; this value is equivalent to the reference dose for the oral route of exposure in Table 4.2.

^bAbsorbed reference doses are calculated by multiplying the administered reference dose by the GI absorption factor; this value is used in the BHHRA to calculate contribution to systemic toxicity from dermal exposure.

Notes: Blank cells indicate that data are not available or are not appropriate.

NoC = Land use scenario not of concern.

Table 5.21 Summary of risk characterization for area I (continued)

Values for ELCR greater than 1×10^{-2} fall outside the calculation bounds in EPA 1989a and are approximate values only.

Total ELCR and total HI columns reflect values from Tables 5.1 to 5.9b for direct contact pathways without lead included.

The ELCR values are those for lifetime exposure. The HI values are those for a child.

Sum of dermal contact while wading and while swimming.

Sum of inhalation of emissions from groundwater while showering and during household use.

Although the land use scenario is of concern, none of the pathway-specific ELCRs exceeded 1×10^{-6} . The driving pathways are direct ingestion (52.0%) and inhalation of vapors (46.4%).

Note: NV = No value was available for this groundwater source for this area.

NoC = Land use scenario not of concern.

Values for ELCR greater than 1×10^{-2} fall outside the calculation bounds in EPA 1989a and are approximate values only.

¹ Total ELCR and total HI columns reflect values from Tables 5.1 to 5.9b for direct contact pathways without lead included.

² The ELCR values are those for lifetime exposure. The HI values are those for a child.

³ Sum of dermal contact while wading and while swimming.

⁴ Sum of inhalation of emissions from groundwater while showering and during household use.

Notes:

HI = Hazard index

ELCR = Excess lifetime cancer risk

NA indicates data were not sufficient to derive risk estimates.

¹All HIs are for a child resident. All ELCRs are for a resident. Only results for Areas a through k are shown.

²For this table, an infrequently detected analyte is one detected in less than 10% of all samples collected.

³Area k includes water drawn from wells completed in Terrace Gravels, Eocene Sands, and Porters Creek Clay.

Note: Values reported were derived from detected concentrations only.

Results taken from material presented in App. H.

“Not Applicable” indicates that risk values were not derived from sampling results because results would have been affected by a known bias.

“No Result” indicates that a risk value could not be calculated because the analyte was not detected.

Number of Observations	13 (3 Eocene Sand; 10 Terrace Gravel)	8 (1 Eocene Sand; 7 Terrace Gravel)	1 (1 Terrace Gravel)

Note: Values reported were derived from detected concentrations only.

Results taken from material presented in App. H.

“Not Applicable” indicates that risk values were not derived from sampling results because results would have been affected by a known bias.

“No Result” indicates that a risk value could not be calculated because the analyte was not detected.

Notes:

NV = no value reported.

- ¹ McNairy = Water drawn from McNairy Formation.
RGA = Water drawn from Regional Gravel Aquifer.
UCRS = Water drawn from Upper Continental Recharge System.
Other = Water drawn from other water bearing hydrogeological unit.

- ² A = Cumulative HI following baseline procedures.
B = Cumulative HI without lead as a COPC.
C = Cumulative HI without contribution from COPCs with withdrawn or provisional reference doses.
D = Cumulative HI without contribution from COPCs with withdrawn or provisional reference doses (including lead) and from COPCs that are common laboratory contaminants.
E = Cumulative HI without contribution from COPCs with withdrawn or provisional reference doses (including lead), from COPCs that are common laboratory contaminants, and from infrequently detected COPCs.

F = Cumulative HI without contribution from COPCs with withdrawn or provisional reference doses (including lead), from COPCs that are common laboratory contaminants, from infrequently detected COPCs, and from analytes that were infrequently analyzed for.

Notes:

NV = no value reported

- ¹ McNairy = Water drawn from McNairy Formation.
RGA = Water drawn from Regional Gravel Aquifer.
UCRS = Water drawn from Upper Continental Recharge System.
Other = Water drawn from other water bearing hydrogeological unit.

- ² A = Cumulative ELCR following baseline procedures.
B = Cumulative ELCR without contribution from COPCs with withdrawn or provisional slope factors.
C = Cumulative ELCR without contribution from COPCs with withdrawn or provisional slope factors and from COPCs that are common laboratory contaminants.

D = Cumulative ELCR without contribution from COPCs with withdrawn or provisional slope factors, from COPCs that are common laboratory contaminants, and from COPCs that were infrequently detected.
E = Cumulative ELCR without contribution from COPCs with withdrawn or provisional slope factors, from COPCs that are common laboratory contaminants, from COPCs that were infrequently detected, and from COPCs that were infrequently analyzed for.
