JAN 10 2017

Mr. Brian Begley
Federal Facility Agreement Manager
Division of Waste Management
Kentucky Department for Environmental Protection
300 Sower Boulevard, 2nd Floor
Frankfort, Kentucky 40601

PPPO-02-3963902-17B

Ms. Julie Corkran
Federal Facility Agreement Manager
U.S. Environmental Protection Agency, Region 4
61 Forsyth Street
Atlanta, Georgia 30303

Dear Mr. Begley and Ms. Corkran:

TRANSMITTAL OF ERRATA PAGES FOR THE REMOVAL ACTION REPORT FOR THE C-410 COMPLEX INFRASTRUCTURE DECONTAMINATION AND DECOMMISSIONING PROJECT AT THE PADUCAH GASEOUS DIFFUSION PLANT, PADUCAH, KENTUCKY, DOE/LX/07-2182&D1

Reference: Letter from T. Duncan to B. Begley and J. Corkran, "Removal Action Report for the C-410 Complex Infrastructure Decontamination and Decommissioning Project at the Paducah Gaseous Diffusion Plant, Paducah, Kentucky, DOE/LX/07-2182&D1," (PPPO-02-3370234-16C), dated April 11, 2016

Enclosed are errata pages for the *Removal Action Report for the C-410 Complex Infrastructure Decontamination and Decommissioning Project at the Paducah Gaseous Diffusion Plant, Paducah, Kentucky,* DOE/LX/07-2182&D1 (D1 RAR). The enclosed errata pages have been prepared to correct an error associated with the designation of Solid Waste Management Unit (SWMU) 41 in Table 1 of the subject document. Specifically, during development of the D1 RAR, SWMU 41 inadvertently was listed in Table 1 (removed SWMUs) rather than in Table 2 (SWMUs filled with flowable fill) of the report. SWMU 41 will be investigated as part of the Soils and Slabs Operable Unit. The error was discovered during development of the revised SWMU Assessment Report for SWMU 478. An errata sheet that summarizes the conforming changes and clean and redline versions of the changed pages are enclosed.

If you have any questions or require additional information, please contact me at (270) 441-6862.

Sincerely,

Tracey Duncan
Federal Facility Agreement Manager
Portsmouth/Paducah Project Office

ERRATA SHEET

Removal Action Report for the C-410 Complex Infrastructure Decontamination and Decommissioning Project at the Paducah Gaseous Diffusion Plant, Paducah, Kentucky
DOE/LX/07-2182&D1, issued April 2016

The following 7 corrections should be incorporated into the document.

1. Solid Waste Management Units Associated with C-410 Section, page 3, 2nd paragraph, 1st line, deleted text "41,"
2. Solid Waste Management Units Associated with C-410 Section, page 3, 2nd paragraph, 5th line, changed text from "are" to "will be."
3. Solid Waste Management Units Associated with C-410 Section, page 3, 2nd paragraph, 6th line, deleted text "41,"
4. Solid Waste Management Units Associated with C-410 Section, page 3, Table 1, deleted row "41, C-410-C Neutralization Tank"
5. Solid Waste Management Units Associated with C-410 Section, page 4, 2nd paragraph, 1st line, changed text from "16" to "17"
6. Solid Waste Management Units Associated with C-410 Section, page 4, 2nd paragraph, 5th line, changed text from "16 to 17" and then deleted the second "16"
7. Solid Waste Management Units Associated with C-410 Section, page 4, Table 2, added row 1 with text "41, C-410-C Neutralization Tank"

DOE/LX/07-2182&D1
Secondary Document

REMOVAL ACTION REPORT FOR THE C-410 COMPLEX INFRASTRUCTURE DECONTAMINATION AND DECOMMISSIONING PROJECT AT THE PADUCAH GASEOUS DIFFUSION PLANT, PADUCAH, KENTUCKY

Description of the Removal Action Implemented

Deactivation, decontamination, decommissioning, and demolition of the C-410 Complex at the Paducah Gaseous Diffusion Plant (PGDP) was warranted based on relevant process knowledge and the nature, concentrations, and potential for release of the identified contaminants of concern (COCs), as documented in the following documents:

- *Engineering Evaluation/Cost Analysis for the C-410 Complex Infrastructure at the Paducah Gaseous Diffusion Plant, Paducah, Kentucky*, DOE/OR/07-1952&D2/R1, (EE/CA) (DOE 2001)

- *Action Memorandum for the C-410 Infrastructure Removal at the Paducah Gaseous Diffusion Plant, Paducah, Kentucky*, DOE/OR/07-2002&D1/R1, (Action Memorandum) (DOE 2002)

- *Removal Action Work Plan for the C-410 Complex Infrastructure D&D Project at the Paducah Gaseous Diffusion Plant, Paducah, Kentucky*, DOE/OR/07-2012&D2, (RAWP) (DOE 2002)

- *Action Memorandum Addendum for the C-410 Infrastructure Removal at the Paducah Gaseous Diffusion Plant, Paducah, Kentucky*, DOE/LX/07-0273&D2, (Action Memorandum Addendum) (DOE 2009)

- *Removal Action Work Plan Addendum for the C-410 Complex Infrastructure D&D Project at the Paducah Gaseous Diffusion Plant, Paducah, Kentucky*, DOE/LX/07-0304&D2/R1, (RAWP Addendum) (DOE 2010)

- *Removal Action Work Plan Addendum for the C-410 Complex Infrastructure D&D Project at the Paducah Gaseous Diffusion Plant, Paducah, Kentucky*, DOE/LX/07-0304&D2/R2 (DOE 2015)

These documents describe the processes and operations that occurred in the C-410 Complex and document the COCs, applicable or relevant and appropriate requirements (ARARs) and to be considered (TBC) criteria, and performance standards for this removal action. Deactivation, decontamination, decommissioning, and demolition of the C-410 Complex was conducted as a Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) non-time-critical removal action (NTCRA) pursuant to DOE's authority under Executive Order 12580 and in accordance with the Federal Facility Agreement (FFA) for PGDP, Section X.E., Non-Time-Critical Removal Actions, and the National Contingency Plan (NCP), 40 *CFR* Part 300.

The first three referenced documents describe the original approach to deactivation, decontamination, decommissioning, and demolition of the C-410 Complex, which entailed removal of all hazardous materials and infrastructure (i.e., piping, equipment, material, platforms, and non-load-bearing interior

walls) from the Complex. At that time, demolition of the Complex superstructures to their respective slabs was intended to be part of a subsequent CERCLA response action to be conducted after the infrastructure removal activities were complete.

The subsequent development of safer and more efficient methods of completing the work led to changes in the scope of the original project, resulting in the preparation and approval of the last two documents. These addenda served to do the following:

1. To expand the scope of the existing NTCRA to include facility structure demolition to the slabs and disposition of demolition debris, and

2. To allow non-process systems to remain in place and to remove these systems at the same time the building is demolished using heavy equipment such as excavators with shears.

The ongoing infrastructure removal activities that were part of the original scope continued during (and ahead of) implementation of the demolition activities.

The revised NTCRA met the removal action objectives agreed upon among U.S. Department of Energy (DOE), the U.S. Environmental Protection Agency (EPA), and the Kentucky Department for Environmental Protection (KDEP), as defined in the Action Memorandum and Action Memorandum Addendum.

The removal action objectives in the 2002 Action Memorandum were the following:

- Remove the materials causing the highest potential risks (e.g., transferable radioactive materials, asbestos, and other hazardous materials such as PCBs); thereby, significantly reducing the risk to current employees and potential off-site receptors in the event of building failure or further degradation to levels within the CERCLA risk range and in compliance with ARARs;

- Reduce the potential for public, worker, and environmental exposure to radioactive and hazardous substances caused by potential uncontrolled releases from the buildings; and

- Remove the infrastructure from the C-410 Complex buildings in preparation for future final cleanup decision making for the remediation of the building structure and environmental media.

In 2009, DOE, in conjunction with EPA and KDEP, issued an addendum to the original C-410 Action Memorandum. This 2009 Action Memorandum Addendum documented the following decisions:

- To expand the scope of the existing NTCRA to include facility structure demolition to the slabs and disposition of the demolition debris; and

- To allow the non-process systems to remain in place and to remove these systems at the same time the building is demolished using heavy equipment such as excavators with shears.

Buildings and facilities located within the C-410 Complex that were included in the NTCRA were the following:

- C-410, Original Feed Plant, including the East and West Expansion
- C-410-A, Second East Expansion of the C-410 Feed Plant (consistent with DOE/OR/07-2012&D2)
- C-410-C, Hydrogen Fluoride (HF) Neutralization Building

- C-410-F, HF Storage Building (North)
- C-410-G, HF Storage Building (Center)
- C-410-H, HF Storage Building (South)
- C-410-I, Ash Receiver Shelter
- C-410-J, HF Storage Building (East)
- C-411, Cell Maintenance Building
- C-420, Green Salt Building

The original RAWP, DOE/OR/07-2012&D2, did not include the C-410-K facility because the facility was constructed later. The RAWP Addendum, DOE/LX/07-0304&D2/R1, included a reference to the C-410-K facility, noting it was not a part of the project scope. The four HF tank structures, specifically C-410-F, C-410-G, C-410-H, and C-410-J were removed as a part of the NTRCA prior to development of DOE/LX/07-0304&D2/R1. As such, these four facilities are maintained in the Removal Action Report (RAR) text.

This NTCRA excludes C-410-B and C-410-E because they are scheduled to be addressed under the Soils and Slabs Operable Unit. The C-410-D and C-410-K Buildings were leased to the United States Enrichment Corporation at the time the project was scoped and currently are in use by the DOE Paducah Deactivation Contractor. The locations of these facilities are shown in Figure 2.

To facilitate planning and implementing the work, the affected buildings were divided into a total of 64 zones. A CD-ROM provided with the RAWP includes IPIX images of each zone. Subdividing the Complex further afforded the flexibility to perform the work on either a zone-specific, multi-zone-specific, or a system-specific basis, as appropriate. Each of the zones is described in Appendix A of the RAWP (DOE 2002).

Solid Waste Management Units Associated with C-410

C-410 Complex consisted of 21 discrete solid waste management unit areas (SWMUs) that were located within and around the C-410 Building structure, as well as one broad SWMU designation (SWMU 478) intended to encompass the overall footprint of the C-410 Complex (for a total of 22 SWMUs).

As part of the C-410 deactivation, decontamination, decommissioning, and demolition activities, SWMUs 494, 495 496, and 497 (see Table 1) have been removed and only the slabs underneath these SWMUs remain. No evidence of releases was identified during deactivation, decontamination, decommissioning, and demolition of the C-410 facility from these areas or that additional action would be necessary. The slabs have been double washed and rinsed, and two contrasting colors of epoxy paint have been applied. These slabs will be included within SWMU 478, which encompasses the entire footprint of the C-410 Complex. SWMUs 494, 495, 496, and 497 will be designated "No Further Action" status as a result of completion of deactivation, decontamination, decommissioning, and demolition activities at the C-410 Feed Plant.

Table 1. C-410 Complex SWMUs (Removed)

SWMU Number	Description
494	Ash Receiver Area in C-410/420
495	C-410-I Ash Receiver Shed
496	C-410 Fluorine/Hydrogen Filters (Northeast Mezzanine)
497	C-410/420 F_2 Cell Neutralization Room Vats

SWMU 478 was the C-410/420 Feed Plant building that now has been removed. DOE will submit a revised SWMU Assessment Report (SAR) for SWMU 478. The revised SAR will state that SWMU 478 will be evaluated for a final action under the Soils and Slabs OU.

The remaining 17 C-410 SWMUs listed in Table 2 were subsurface features (pits and sumps) that were cleaned of all debris, water, and sludge and then backfilled with flowable fill with a 6-inch concrete cap. Consistent with the RAWP, the building slabs were inspected visually, surveyed, decontaminated, and sealed with two coats of epoxy paint and a radiological survey was completed after epoxy application. The revised SAR for SWMU 478 will include references to these 17 C-410 SWMUs. These SWMUs are within the footprint of SWMU 478 and also will be investigated as part of the Soils and Slabs OU.

Table 2. C-410 Complex SWMUs (Filled with Flowable Fill)

SWMU Number	Description
41	C-410-C Neutralization Tank
498	C-410/420 Sump at Column D&E-1&2
499	C-410/420 Sump at Column H-9&10
500	C-410/420 Sump at Column U-10&11
501	C-410/420 UF6 Scale Pit Sumps A&B
502	C-410/420 Sump at Column U-9
503	C-410/420 Sump at Column G-1
504	C-410/420 Sump at Column L-10
505	C-410/420 Sump at Column A-3N

510	C-410/420 Sump at Column P&Q-2
511	C-410/420 Sump at Column Q&R-2
512	C-410/420 Sump at Column R-2
513	C-411 Cell Maintenance Room Sump Pit

C-410 Complex Overview

Figure 1 is a photo of the C-410 Building prior to demolition. Figure 2 shows the location of the buildings and other structures located within the C-410 Complex.

Summary of Results

Implementation of the C-410 Non-Time-Critical Removal Action was completed successfully, and without any accidents that jeopardized worker safety and in compliance with ARARs. The project involved removing the hazardous substances, such as asbestos, polychlorinated biphenyls (PCBs), and radioactive materials, and disposing of them properly. Further, the structure of the building was demolished to slab. The demolition did not involve removal of the slab, subslab penetrations, and/or foundations. The slab was surveyed for radioactive materials, visually inspected for residual materials or staining, and sealed with two coats of epoxy. Pits were filled with flowable fill and covered with a concrete cap.

Waste was segregated, packaged, and dispositioned to a combination of facilities in accordance with ARARs: the on-site C-746-U Landfill; the Nevada National Security Site (NNSS) (formerly known as the Nevada Test Site); and Energy*Solutions*.

Figure 1. C-410 Building Prior to Demolition

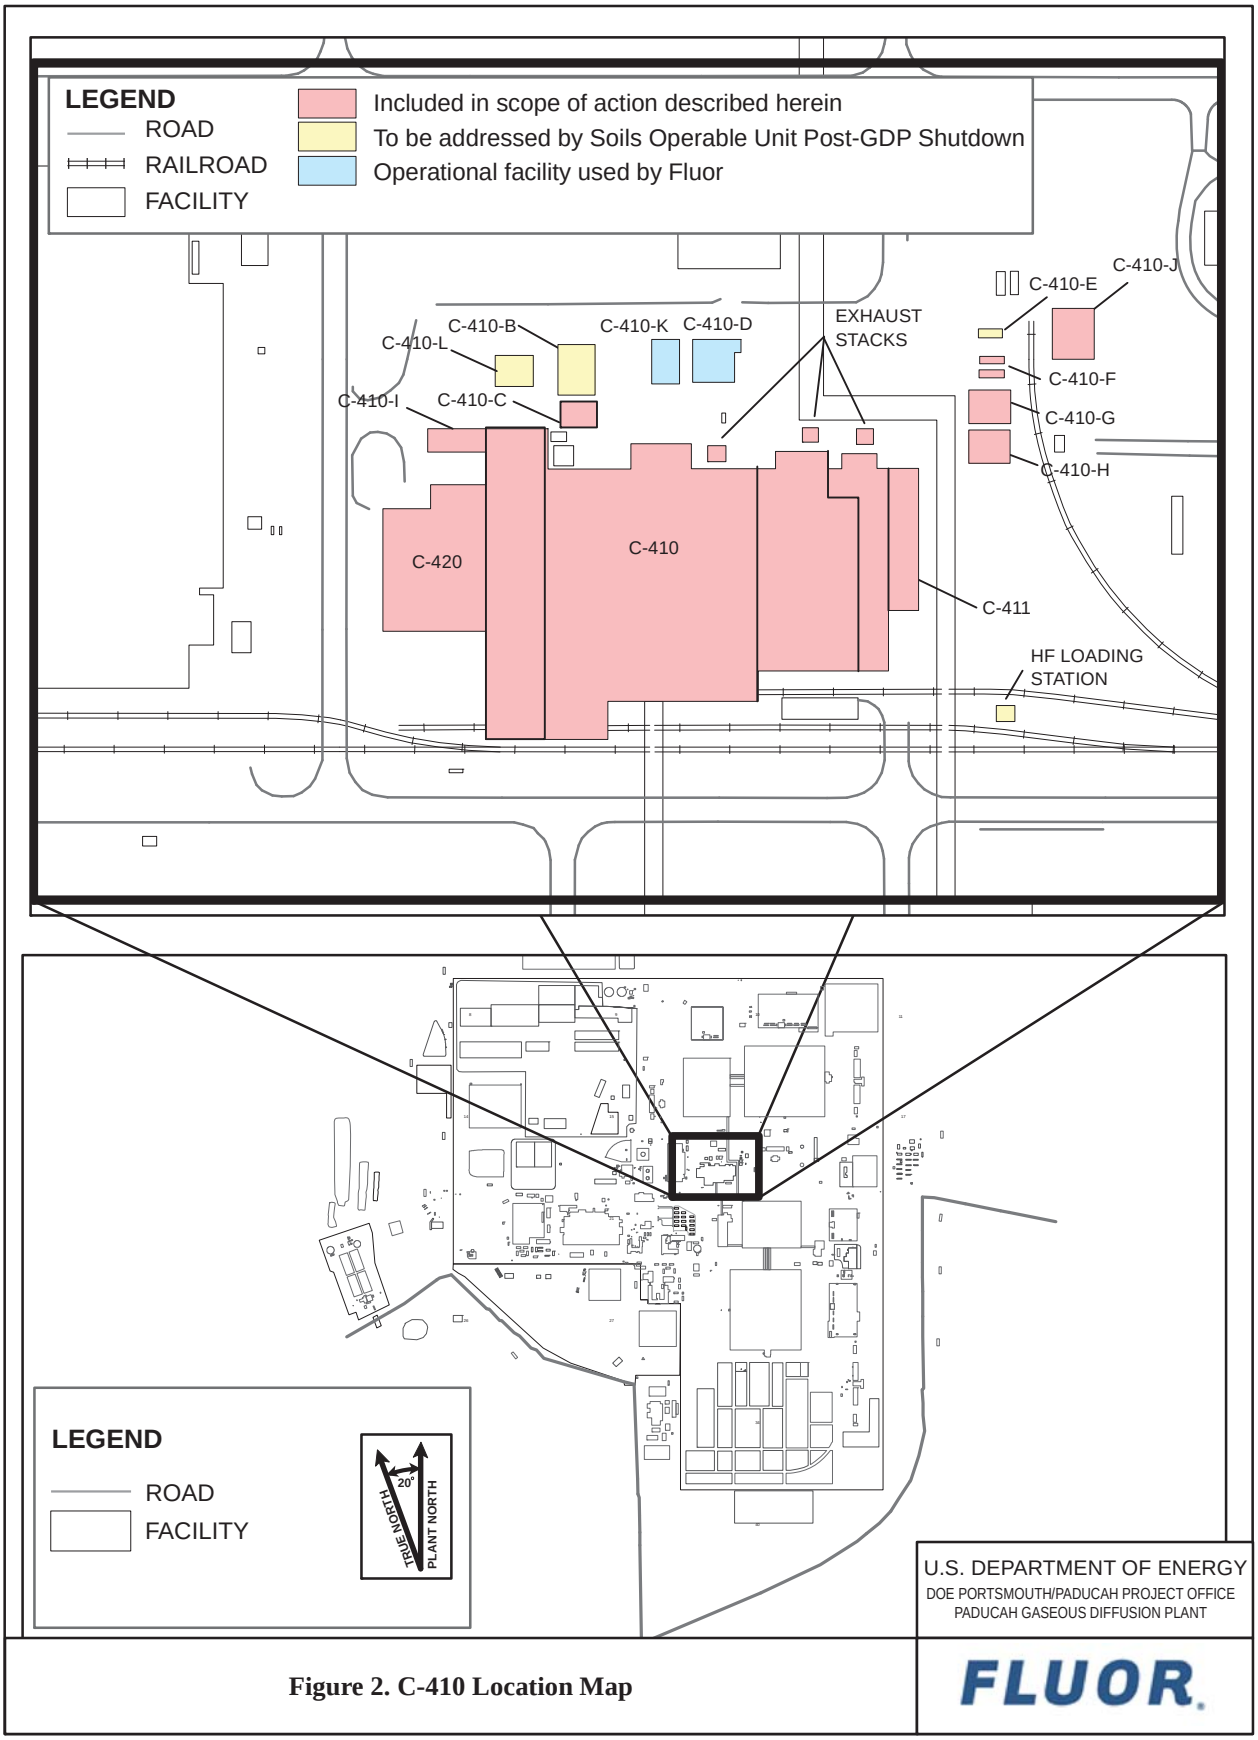

Figure 2. C-410 Location Map

G:\GIS\ARCVIEWS\PROJECTS\c5ac90005sk051R6.mxd
1/20/2016

Seventy fluorine generating cells that had originated in the C-410 Complex were decontaminated by removing PCB-contaminated paint and turned over to private industry for reuse. Additionally, copper buswork and equipment that had supported the fluorine cell operations were shipped for reuse.

Infrastructure Removal[1]

The infrastructure removal at the C-410 Complex began on February 26, 2003. Initial activities included the stabilization and removal of the HF Tank Farm located east of the main C-410 Building. HF piping, pumps, and valves were drained and removed. Protective structures over the tanks were removed to allow access to the tanks, and the tanks were cleaned out and removed. The tanks, piping, and equipment were packaged for off-site disposal.

Initial activities inside the C-410 Complex involved establishing boundary control stations (BCSs) to ensure that radiological and other contamination was not carried out of the complex. BCSs provided locations for workers to don the appropriate personnel protective equipment (PPE) prior to entering the facility and a location to remove the PPE safely upon exiting the facility. Monitoring equipment was established at these locations for verifying workers exiting the facility did not have radiological contamination on their clothing or skin upon leaving the facility. Used PPE was collected at the BCS for either for laundering for reuse or disposal. Later in the project, automated "1/2 body monitors" were installed to monitor personnel exiting the facility automatically, improving effectiveness and efficiency of the monitoring process.

During the time frame that the C-410 Complex was not in operations, substantial quantities of used equipment and surplus materials from throughout the plant were stored inside the building. In order for workers to have access to the installed systems and equipment for stabilization and/or removal, packaging and disposal of this material was required. Characterization, packaging, and disposal of these "loose materials" was initiated at the beginning of the infrastructure removal project and continued throughout the project as work progressed through the different areas of the building. Additionally, one of the early infrastructure removal activities included the decontamination of 70 fluorine generation cells that had been used in the C-410 Complex. The cells underwent a sponge blasting process to remove paint that contained PCBs; the cells then were turned over to a private company for reuse. Other equipment that supported the fluorine generating process, including copper buswork, switches, fluorine cell movers, etc., were decontaminated and transferred for reuse.

As the removal and transfer of the fluorine generating equipment was moving toward completion, removal of asbestos from equipment and piping began. In many areas of the C-410 Complex, piping was layered due to the complex nature of the processes that occurred. As such, initial abatement of asbestos piping and equipment, in many cases, was the "accessible" or the "outer layer" of piping. In some areas, following abatement of the asbestos on the first layer of piping, the abated piping could be accessed to perform stabilization or removal, as required. This then allowed access to the "next layer" of piping, which, in some cases, required asbestos abatement. This layering of piping resulted in abating, then stabilizing and removing piping, then abating the next layer of asbestos pipe, throughout the removal action.

In 2009, the C-410 Project was selected as an American Recovery and Reinvestment Act (ARRA) project, resulting in an opportunity to apply additional resources and accelerate the project. To take advantage of the opportunity provided by the increased ARRA funding, an Action Memorandum Addendum and RAWP Addendum were developed, expanding the scope of the removal action to include structural demolition of the C-410 Complex and to allow non-process piping and systems to remain in

[1] This section addresses the provisions of Section 3.4.6 of the RAWP.

place and be demolished with the building using heavy equipment. Using ARRA funding, the completion of infrastructure removal and demolition of the eastern portion of the C-410 Complex was accelerated. Demolition of C-411 and the Second East Expansion of C-410, consisting of approximately 30,000 ft^2, was completed in 2011.

During the piping stabilization and removal, it was expected the process systems would be empty; however, in many of the systems, such as the glycol, alcohol, and UF_6 systems, it was identified that substantial quantities of the original chemical contents (i.e., holdup material) remained in the systems. For systems such as the glycol and alcohol systems, the impact of the presence of holdup material was limited to additional time to drain and collect the material and then to characterize, manage, and dispose of the recovered material. The impact of holdup present for systems, such as UF_6 or fluorine systems, were more significant due to the hazard presented and effort required to remove the holdup material.

A chemical trap was designed and constructed to evacuate the UF_6 or fluorine systems, and "hot taps" were fabricated to allow safely gaining access to closed systems to implement the evacuation process. In some cases, the UF_6 piping was found to contain deposits that could not be removed effectively with the traps. For these pipes and components, stabilization was performed using the chemical traps; this stabilization allowed the pipe or component to be cut and removed safely from the system. The component then could be "dipped" in a solution to neutralize and remove the larger UF_6 deposits. The components and solutions were characterized and disposed of in accordance with ARARS.

Due to the potential for recoverable quantities of UF_6, the 20 UF_6 cold traps located in the C-410 Complex were placed into storage for future asset recovery. Bolted and/or welded caps were installed on the openings to the traps; they were placed in to Sealand containers prior to relocation to the C-746-Q facility for storage.

The C-410 infrastructure removal required stabilization and removal of multiple systems in the C-410 Complex. These systems required identification, characterization, and removal of residual material from equipment and piping [except when the waste acceptance criteria (WAC) for the receiving facility allowed for disposition of the equipment or piping with the residual material intact] and transportation and disposition of equipment, piping, and residual materials. This included removal and abatement of asbestos-containing materials (ACM), mercury-containing switches and manometers, and PCB-containing electrical equipment (e.g., capacitors). All of the work was performed in accordance with ARARs and TBC criteria of federal and state environmental laws and regulations.

The following are the process systems or process components that were addressed during the infrastructure decontamination and decommissioning portion of the project.

- C-410 HF Reactors
- C-410 Hydrogen Reactors
- C-410 Fluorine (F_2) Reactors
- C-410 Cold Traps/Refrigeration
- C-410 Vacuum Cleaning
- Ash Grinding
- C-420 F_2 Reactors
- C-420 HF
- C-420 Uranium Hexafluoride
- C-420 Vacuum Cleaning
- C-420 HF Recovery
- Alumina Traps
- Fluorine Generation

- Freon System
- Glycol System
- Alcohol System
- HVAC System
- Electrical Distribution Systems

Additionally, the Action Memorandum Addendum included non-process systems (i.e., steam, air, nitrogen, plant air, etc.) in the demolition portion of the project. In some cases, however, the non-process system piping or components were removed to allow access to process systems that required stabilization or removal.

Building Demolition[2]

Prior to demolition, a storm water/run-off plan was developed consistent with identified ARARs. Controls installed to control storm water pollutants and sediments included covering all storm drains with filter fabric, apatite media, and dense grade aggregate; placing sandbags at openings to provide a 4-inch curb around foundation; and using the basements in Zone 22 and Zone 26 to hold storm water collected on the foundation. In addition, fixatives were used where feasible to eliminate fugitive dust emissions in lieu of misting to minimize the volume of water generated.

Exterior transite paneling was removed (deconstructed) using manlifts prior to demolition of the superstructures. The demolition of the facility was accomplished using standard construction equipment, excavator-mounted shears, and excavator-mounted grapples. Demolition of the structure included removal of the non-process infrastructure that remained after the process infrastructure was removed during the first phase of the project.

Dust suppression methods were utilized before, during, and after building demolition and during waste packaging activities. Suppression methods included water misting with a DustBoss®, hand-held hoses for spot suppression, and the use of fixative.

C-410 demolition did not involve removal of the slab, sub-slab penetrations, and/or foundations; however, subsurface features (e.g., pits and sumps) were filled with flowable fill and covered with a concrete cap.

Photos of the demolition of the C-410 Complex are included in Appendix A.

After demolition was complete, the slab was inspected visually, decontaminated, as appropriate, and sealed to minimize the possibility of spreading contamination. Successful removal of paint chips was verified by visual inspection of the slab and soils immediately adjacent to the slab. Radiological characterization was completed in accordance with the RAWP (DOE 2002). The slab was sealed with two coats of epoxy paint. After epoxy paint application, then another radiological survey was completed.

Demolition activities were completed in accordance with PAD-PLA-QM-001, *Quality Assurance Program Implementation Plan for the Paducah Environmental Remediation Project*; the approved RAWP (DOE 2002); and the approved RAWP Addendum (DOE 2010).

In general, demolition of the C-410 complex was completed in accordance with the steps outlined below; with exception to C-410 (Second West Expansion) in which Zones 22 and 26 remained open to collect runoff for better storm water management; subsequently, these Zones were filled with flowable fill after

[2] This section addresses the provisions of Section 2.3.5 of the RAWP Addendum.

demolition of the building. In C-420 (Green Salt Plant), the elevator pits were not filled with flowable fill until after demolition of the building.

- Perform gross decontamination.
- Spray all surfaces with fixative following deactivation.
- Remove remaining equipment/mezzanines/platforms.
- Clean pits/basements.
- RADCON/environmental survey and release pits/basements for flowable fill with a concrete cap.
- Install flowable fill with a concrete cap in pits/basements.
- Remove transite corrugated siding.
- Sever roof and roof sheathing.
- Demolish structure and roof simultaneously.
- Sort, size, and package debris.

Finish Work

1. Demolished all remaining exterior walls.

2. Cut all anchor bolts and steel flushed with concrete surface.

3. Demolished vent stacks and towers.

4. Sorted, sized, and packaged debris as directed by waste generation technicians.

5. Used flowable fill as a backfill material placed in all subgrade pits and subbasements. All flowable fill installations to subgrade pits and subbasements received a six-inch concrete cap to provide a stable surface to support operation of demolition equipment. Removable contamination on the building slab, "existing and replaced," was decontaminated using normal decontamination techniques (washing, scrubbing, wiping, vacuuming, etc.) in such a manner to minimize the generation of waste.

6. Installed radiological signs and postings, as appropriate.

7. Decontaminated rental equipment.

8. Repaired or removed access roads.

9. Graded and seeded, as needed.

Slab Verification Survey and Epoxy Coated Surface[3]

All anchor bolts, piping, and metal framing were removed from the slabs using cold cutting and hot work methods, such as metal cutting saws, reciprocating saws, and torches. Samples were collected from the bottom of the basements/sumps. Sumps and pits were cleaned and backfilled with flowable fill with a concrete cap.

The slabs were inspected visually to identify any residual materials or staining in accordance with the C-410 Complex Demolition Verification Removal Action Plan to determine if residual hazardous substances were in or present on the slab. Flowable fill was used as a backfill material placed in all subgrade pits and subbasements. All flowable fill installations to subgrade pits and subbasements

[3] This section addresses the provisions of Section 2.3.5 of the RAWP Addendum.

received a six-inch concrete cap to provide a stable surface to support operation of demolition equipment. Removable contamination on the building slab, "existing and replaced," was decontaminated using normal decontamination techniques (washing, scrubbing, wiping, vacuuming, etc.) in such a manner as to minimize the generation of waste. Radiological characterization was performed on the concrete building pad following demolition of the building and debris removal (dated August 10, 2015, see Appendix B). A final survey of entire slab was performed after application of two coats of epoxy paint to determine the appropriate radiological postings required for the slab.

Over 100 data points were measured during performance of the final survey. As expected based on historical operations, fixed radiological contamination was found on the slab, with alpha contamination identified at levels up to 19,789 disintegrations per one hundred square centimeters (dpm/100 cm^2), and beta/gamma contamination was identified at levels up to 136,267 dpm/100 cm^2 during survey performed after epoxy coating application on the slab.

The post-epoxy coating survey indicated no removable contamination above transuranic limits, which are 20 dpm/100 cm^2 removable alpha contamination and 1,000 dpm/100 cm^2 removable beta contamination. Based on post-epoxy coating application surveys, the slab was posted as a Radioactive Material Area, Fixed-Contamination, Underground Radioactive Material, and Contamination Area.

The radiological surveys are provided in Appendix B. Radiological surveys were performed in accordance with *Environmental Radiological Protection Program*, CP2-ES-0103.

Sump Verification Survey and Water Disposal[4]

Figure 3 depicts the design and construction of the C-410 Complex slabs. Prior to sampling, all material and debris was removed from the basements/sumps, and core samples of the concrete from the pit walls were collected. Sampling results are summarized in Table 3, and the data are provided in Appendix C. Data collection was performed in accordance with *Paducah Gaseous Diffusion Plant Programmatic Quality Assurance Project Plan*, DOE/LX/07-1269&D2/R2 (available online).

A total of 16,630 gal of contaminated water was pumped from Zone 22 basement on June 18, 2014, prior to building demolition. This water was shipped off-site on September 16, 2014; September 26, 2014; and September 30, 2014, in tanker trucks. This water event was a result of the degrading condition of the building and roof system.

[4] This section addresses the provisions of Sections 2.3.4 and 2.3.6 of the RAWP Addendum.

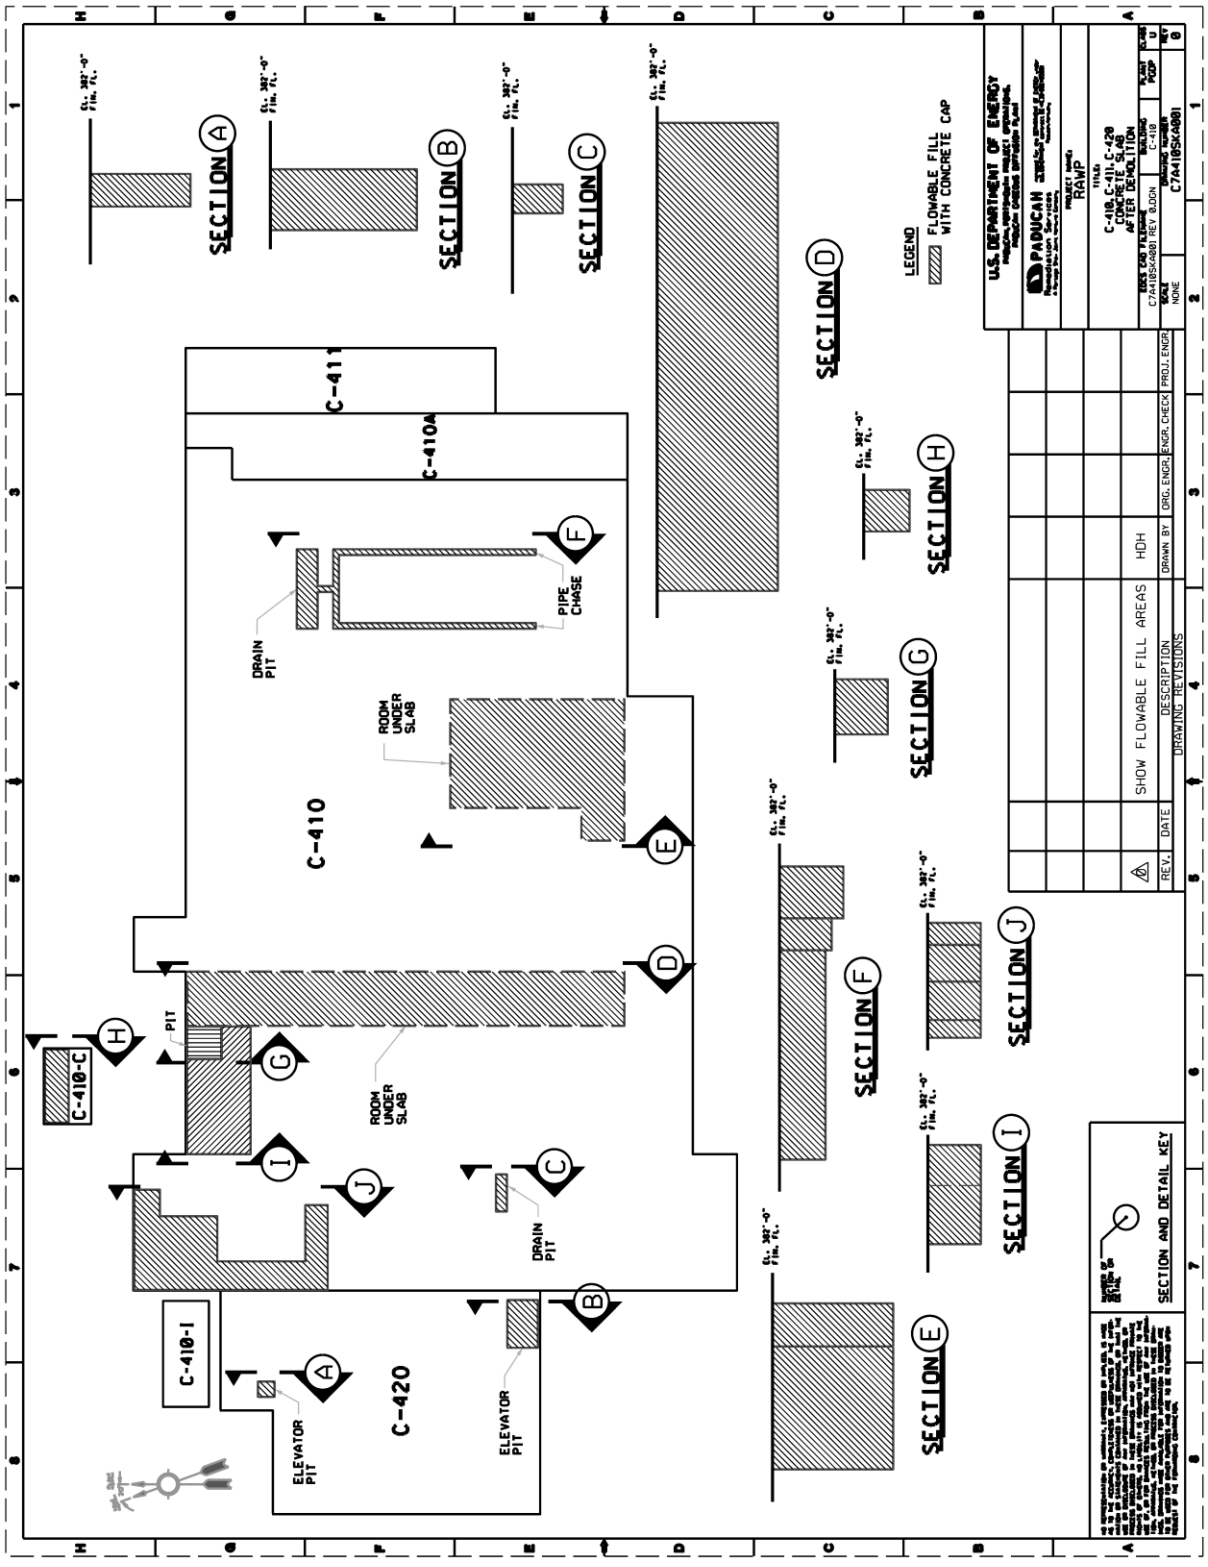

Figure 3. C-410 Map

Table 3. PCB Sump Samples

Sample Number	Location	Aroclor 1248 (mg/kg)	Total PCB (mg/kg)
410-BSMTZ22-CONC	C-410 Zone 22 Basement	0.009	0.92
410-BSMTZ26-CONC	C-410 Zone 26 Basement	0.036	1.900
410-BSMTZ28-CONC	C-410 Zone 28 Basement	0.0088	0.63
410-BSMTZ53-1-CONC	C-410 Zone 53 Basement	0.08	0.1
410-BSMTZ53-2-CONC	C-410 Zone 53 Basement	0.08	0.2
410-BSMTZ53-2-CONCD	C-410 Zone 53 Basement	0.08	0.12
410-BSMTZ54-1-CONC	C-410 Zone 54 Basement	0.08	0.1
410-BSMTZ54-2-CONC	C-410 Zone 54 Basement	0.08	0.1

In addition to water removed from Zone 22, approximately 68,000 gal of contaminated water was generated during this project and removed from Zone 26 prior to backfill with flowable fill with a concrete cap. The water was sampled and analyzed for Tc-99 and uranium, consistent with the Memorandum of Agreement (MOA) (Appendix D). Based on these results, treatment of this water was completed by ion exchange and filtering to remove suspended radionuclides. Following treatment, the water was sampled, analyzed, and discharged in accordance with the MOA (results found in Appendix C). The water was treated and discharged with completion date of October 7, 2015. The carbon media and ion exchange resin used for water treatment is suitable for reuse; therefore, it remains in-tact. The water treatment system has been stored for future projects.

Waste Segregation, Packaging, and Disposal[5]

Implementation of the NTCRA generated 774,518.7 ft^3 of demolition debris, not including contaminated water. The demolition material was segregated into two primary waste streams. The demolition generated 74,212.1 ft^3 of debris that met the waste acceptance criteria and was disposed of in the on-site C-746-U Landfill. Disposal of this waste stream, which included the transite removed from the building exterior, was completed December 31, 2015. The remaining debris was disposed of at NNSS, Perma-Fix, and Energy*Solutions*, and the final shipment was completed on January 12, 2016.

A total of 16,630 gal of contaminated water was pumped from Zone 22 basement on June 18, 2014, prior to building demolition. This water was shipped off-site on September 16, 2014; September 26, 2014; and September 30, 2014, in tanker trucks. This water event was a result of the deteriorating condition of the building and roof system.

The project resulted in the generation of 4,111.4 ft^3 of PCB remediation low-level waste (LLW) waste at levels of PCBs above 50 ppm. This PCB waste was disposed of at Energy*Solutions.* The final shipment of this material was on June 18, 2014.

[5] This section addresses the provisions of Sections 2.3.4 and 2.3.6 of the RAWP Addendum.

The project also generated 37,542 ft^3 of LLW that required disposition at the NNSS, based on levels of depleted uranium. The final shipment of this material occurred December 2013.

Approximately 6,746 ft^3 of mixed waste or hazardous waste was generated during the removal action. This material was dispositioned at Energy*Solutions*, M&EC, DSSI, Perma-Fix, or Toxco. The final shipment of this material occurred on November 12, 2015.

During the planning phase of the C-410 Removal Action, DOE assumed the cold traps contained only a thin film of UF_6 material. During the C-410 decommissioning activities, however, DOE discovered that the cold traps contained significantly more UF_6 than had been anticipated. During the May 2012 and August 2012 meetings of the Federal Facility Agreement (FFA) managers, DOE discussed its intent to place the C-410 cold traps into storage for future recovery of UF_6 material during PGDP decommissioning when systems are in place to remove the UF_6 material safely and economically. EPA and KDEP concurred that this approach is consistent with the referenced RAWP.

Additional decontamination of government furnished equipment was required to enable the use of the equipment on other projects in January and February 2016. The waste generated by this activity was tracked separately. A total of 2,050 gal of water was shipped April 8, 2016, for off-site disposal, and 450 ft^3 of PPE has been disposed of in the on-site landfill.

Approximately 1,995 ft^3 of waste was generated at EDI in Oak Ridge, Tennessee, during decontamination of the three excavators and one grapple used in building demolition. This waste was shipped April 7, 2016, to Clive, Utah, for disposal.

The approved RAWP for the C-410 Complex allows for the recycle/reuse of materials from the decommissioning of the C-410 Complex. Fluorine cells and copper bus bars were removed for off-site reuse and shipped to Toxco.

Contamination Control

During the performance of the C-410 demolition, activities that had the potential to involve radioactive materials or radioactive contamination were conducted in accordance with the *LATA Environmental Services of Kentucky, LLC, Radiation Protection Program*, PAD-PLA-HS-002/R2. Routine radiological surveys were performed on predetermined schedules by the radiation protection staff. Additional samples were obtained before, during, and following the completion of work that could affect radiation/contamination levels.

Radiological surveys included exposure rate measurements from the following locations within each structure: (1) from the general area; (2) at 30 cm from a source or surface of interest; and (3) on contact with potential sources of radiation where hands-on work was occurring. Radiological surveys also were performed in and adjacent to potentially contaminated areas to evaluate contamination levels and identify any spread of contamination beyond established boundaries.

Implementation of the C-410 NTCRA was a very labor intensive activity, requiring workers to work in and near radiological contaminated equipment and facilities throughout the duration of the project. Engineering controls, administrative controls, and personnel protective equipment were utilized to protect workers throughout the project. Examples of these controls included use of fixatives to control contamination; handling materials with equipment rather than manually; negative air machines to capture and reduce airborne contamination; radiological work permits; workforce training, monitoring of personnel and equipment before exiting the facility, and PPE.

Throughout the project, 22 personnel contamination events occurred. A personnel contamination event is defined as contamination of worker's skin, company issued clothing, or shoes. Of these 22 events, a total six of involved radiological contamination present on a worker's skin, while the remainder involved contamination on scrubs, coveralls, or boots. Contamination on skin was removed by washing with mild soap and water. Company-issued clothing that became contaminated generally was disposed of as a part of project waste.

Contamination events were evaluated on an ongoing basis to determine if improvements to controls or processes could be implemented to reduce likelihood or extent of future occurrences. Changes and modifications to controls were implemented, as appropriate. In consideration of the number of hours worked and potential for contamination presented by work activities, the radiological control program was effective at protecting the work force from radiological contamination and in preventing contamination from leaving the facility.

Material and equipment released from radiological areas to controlled areas, or for unrestricted release, were monitored by radiological control personnel. No vehicles, heavy equipment, tools, or equipment were removed from the C-410 area without written certification that the equipment had undergone a radiological survey and had met the appropriate release criteria.

Area Air Monitoring

Over 25,173 discrete air samples were collected for radiological contamination, asbestos, and metals in all phases of the project, during and prior to demolition. These samples comprised of breathing zone personnel monitoring samples for workers, area monitors, perimeter monitors, and clearance samples.

A total of 17,804 breathing zone samples was collected. Of these samples, a total of 285 breathing zone samples exceeded the DOE occupational limit for radiological contamination that triggers use of respiratory protection. The workers for which these samples were collected were using the appropriate protection.

Additionally, 7,369 perimeter or area monitoring samples were collected for radiological contamination. None of the area or perimeter monitors indicated presence of airborne radioactive materials at the DOE occupational limit. The perimeter samples were collected using solar powered samplers, running continuously, with samples nominally collected twice weekly. None of the 121 area samples representing 1,786 results and only 33 out of 4,294 results from 415 personnel samples collected and analyzed for airborne metals exceeded the Occupational Safety and Health Administration permissible exposure limits or the American Conference of Governmental Industrial Hygienists threshold limit values. The workers for which these samples were collected were using the appropriate protection.

A total of 186 perimeter samples was collected for asbestos during building demolition and transite removal. These were compared to an administrative control level for asbestos perimeter sampling of 0.01 fibers per cm^3.

A total of 1,400 breathing zone asbestos samples was collected during the transite removal and asbestos abatement activities.

Required clearance samples were performed in accordance with ARARs, including 401 *KAR* 58:040 4(2)(c). All clearance monitoring results met the applicable standards for successful abatement as defined in the ARARs.

Summary of Problems Encountered, including Deviations from the Work Plan

The expected condition of piping and equipment in the C-410 Complex was that most systems would be drained or purged and materials removed during the shut down of the building. Records indicated equipment had been "run till empty." Residual levels of liquids were expected in systems such as the glycol or alcohol systems, and the UF_6 systems were expected to contain only residual levels of material. Solid material handling systems were not expected to contain substantial quantities of solid material. However, during the stabilization and removal of most process systems, substantial quantities of hold up material remained in the systems. For systems such as the glycol and alcohol systems, the impact of the presence of material was limited to additional time to drain and collect the material, and then the efforts to characterize, manage, and dispose of the recovered material. The impacts to systems such as the UF_6 system or the fluorine systems, however, were more significant. Trapping equipment was designed and constructed to remove hazardous gases from the UF_6 and fluorine containing systems, as well as hot tapping equipment to allow a controlled mechanism to access the normally closed systems. For solid containing systems, such as UF_4 or uranium powder systems, the solid material was removed via shoveling, vacuuming, etc.

For the UF_6 cold traps, the holdup material quantities were such that the traps were placed into storage for later asset recovery, as opposed to stabilizing the traps and disposing of them.

During implementation of the removal action, UF_6 releases occurred in the C-410 Building on four occasions. No significant injuries or illnesses occurred from these releases; however, work activities were paused following each of these to allow for investigation and corrective action implementation. A description of the releases and cause is provided below:

- March 1, 2006—A release occurred when a small diameter UF_6 line was broken inadvertently during other work activities. Corrective actions included detailed inspections of the building and flagging or painting small diameter UF_6 lines. Work activities were controlled or prohibited in immediate area of these lines until they could be stabilized and removed. Release did not extend outside of the building.

- August 11, 2008—A UF_6 line was damaged during asbestos abatement of the line, resulting in a small release of UF_6 inside the asbestos enclosure. The personnel left the area, as required by work controls. A hazmat team entered and determined the release had stopped on its own. Release did not extend outside of the building. Work resumed following monitoring of the area.

- July 2010—A release occurred while a UF_6 line was being purged through a hot tap. Leak stopped following hazmat entries, and the release appeared not to have escaped the C-410 Building. Hot taps were redesigned to a more robust design, and more rigorous work controls were implemented, including design and deployment of chemical traps rather than an HF-capable negative air machine (NAM) to purge the UF_6 lines.

- May 2011—A release occurred when a work crew using a saw "nicked" a line, and the resulting UF_6 overwhelmed the HF capable NAM. This approach was inconsistent with the work and hazard controls established for this work, which called for implementing hot tapping and use of chemical traps for purging unknown lines. More robust work controls were implemented with hold points to ensure work control steps were followed and hazard controls implemented.

On February 14, 2012, work was suspended on UF_6 piping and equipment removal due to presence of elevated levels of plutonium contamination in UF_6 process lines in the C-410 Complex. The contamination levels required implementation of more robust work controls than currently were in place and those had been based on expected plutonium concentrations. Work controls were revised, additional

PPE implemented, and additional training was provided to the workforce performing this activity, as well as to support staff. Additionally, no other work was permitted in the immediate area of the UF_6 piping removal. Finally, plans were put into place to decontaminate the area following completion of removal of the UF_6 piping. Work resumed on the piping on March 13, 2012.

In December, 2009, a PCB transformer located in the basement of the First East Expansion of the C-410 Complex, located at the intersection of Building Column Line O and Column Line 10, had a small leak, impacting an area approximately 12 inches by 26 inches on the basement floor. Residual material was cleaned from the slab at the time of the event. The area was marked with paint and covered with plastic to demarcate the area of the spill when flowable fill was installed in this basement.

The C-410 Complex roofs and roof drains were in deteriorated condition due to the age of the buildings. A sealant was applied to the roof to control leaks during the project. Additionally, efforts to "patch" roof drains and divert water from roof leaks or damaged/nonfunctioning roof drains were required. Surveillance and maintenance costs were increased as a result. Routine engineering evaluations of the structural integrity of the building roofs were performed to confirm the safety of workers making entry.

The C-411 Building and the C-410 Second East Expansion were demolished approximately 3 years before demolition of the balance of the building. Following the demolition of C-411 and the Second East Expansion, a water leak resulted in accumulating approximately 75,000 gal of water in the basement area under the First East Expansion (Zone 54 Basement). This water was characterized, determined to have low levels of PCB contamination, treated via carbon filtration, and discharged. Repairs were made to the roof and wall interface to prevent recurrence.

Prior to demolishing the balance of the C-410 Complex, approximately 16,000 gal of water accumulated in Zone 22 due to deterioration of the roof and the drain pipe systems that had managed the water from the roof surface. On-site treatment capacity for this water was not available at that point. The water collected from this event was shipped off-site for disposal.

The Demolition Plan for the C-410 Complex anticipated that all free liquids would be removed from all basements, pits, trenches, and sumps in zones scheduled for immediate demolition, and that these areas would be filled with flowable fill with a concrete cap (see Demolition Plan, Pre-Demolition Conditions, Paragraph 18 and Main Tasks, Paragraph L). In the case of Zones 22 and 26, the subsurface areas remained open to collect run-off for better storm water management. On September 26, 2014, DOE proposed to EPA and KDEP its plan for discharge of the collected storm waters to an adjacent ditch and eventually to Outfall 001. This proposal was disapproved by the regulators, and EPA issued "Stop Work Order on the Discharge of Wastewater from Building C-410 Removal Action, Paducah Gaseous Diffusion Plant," on November 26, 2014. In late December 2014, a separation wall was built between Zones 22 and 26 using precast concrete blocks and concrete. The storm water was consolidated into Zone 26 in early January 2015, and Zone 22 was filled with flowable fill with a concrete cap to allow building demolition to proceed.

On July 31, 2015, the FFA parties finalized the Memorandum Of Agreement for Disposition of Contaminated Water Collected from the Basement of the C-410 Complex at the Paducah Gaseous Diffusion Plant, in which DOE agreed to remove the water from Zone 26 basement and treat using *ex situ* at Zone 26 using proven ion exchange technology with resins capable of treating radionuclides detected in the water. The ion exchange treatment system achieved 93%–98% reduction in the radionuclides, results in Appendix C. Treatment and discharge of the water was completed on October 7, 2015.

The elevator pits in C-420 remained open due to the safety issues involved in locking out and blocking up the elevator cars and counterweights. The pits were filled with flowable fill with a concrete cap after the

building structure was demolished. This differs from the RAWP because the pits were filled with flowable fill with a concrete cap after building demolition, as opposed to prior to building demolition.

On May 29, 2015, the project requested a deviation (DOE 2015) from the RAWP to allow transportation of four excavators to an off-site vendor for decontamination prior to returning the equipment to the vendors. The equipment required partial disassembly with aggressive methods for effective decontamination. The complexity of this decontamination effort prevents the effective and timely completion of the activities on-site with currently available facilities and equipment. Large, high bay equipment decontamination and disassembly areas with material handling equipment and the tooling required to disassemble large equipment were needed for disassembly and reassembly. Abrasive blasting equipment with necessary environmental controls (dust collectors, recycling equipment, etc.) was needed to perform the decontamination effort. Completing the disassembly, decontamination, and reassembly could be completed more efficiently and in a timelier manner by sending the equipment to an existing off-site facility at this time.

Prior to shipment for decontamination, the determination was made that one of the four excavators would be purchased for potential future use. As a result, three excavators and one grapple were shipped off-site for decontamination. All three of the excavators and the grapple attachment have been decontaminated and have been returned successfully to the rental company.

Summary of Accomplishments and/or Effectiveness of the Removal Action

Deactivation and demolition of the C-410 Facility was accomplished in accordance with the RAWP and RAWP Addendum. Waste handling, segregation, packaging, shipping, and disposal were accomplished in accordance with ARARs.

Timeline for Completion

Table 4 illustrates the timeline for the deactivation, decontamination, decommissioning and demolition phase of the C-410 demolition program. The demolition was initiated March 23, 2011.

Table 4. Timeline of NTCRA for the C-410 Complex

Date	Activity
2/26/2003	Initiated Removal Action by beginning removal of Hydrofluoric Acid (HF) Tank Farm.
10/2003	Completed isolation of external sources of steam, air, nitrogen, and condensate system from the C-410 Complex.
5/2004	Completed modifications on the C-410-C Limehouse to support fluorine cell decontamination for off-site shipment for reuse.
5/2004	Completed implementation of DOE required Nuclear Facility Safety Basis for C-410 Complex for activities inside the C-410 Complex.
7/2004	Completed demolition of HF tank farm.
9/2004	Completed disposition of 11 HF Tanks at NTS.
10/2004	Completed decontamination (PCB containing paint removal) & off-site shipment of the 57 fluorine cells from the C-410 complex for reuse.
7/2005	Initiated the removal of PCB contaminated paint from fluorine cells that had breaches in water jackets. These 13 cells were returned to C-410 from waste storage for decontamination.
9/2005	Completed conversion of C-420 Administrative area into a Boundary Control station.
1/2006	Completed infrastructure removal in C-411 Cell maintenance area (eastern end) of C-410 Complex.
2/2006	Transferred first Sealand container of copper bus work from C-410 Complex to an off-site contractor for reuse.

Table 4. Timeline of NTCRA for the C-410 Complex (Continued)

Date	Activity
3/2006	UF_6 release inside C-410 when small diameter instrument line was inadvertently broken. Work paused inside building while investigating cause and implementing corrective actions.
4/2006	Initiated building walkdowns and demarcating lines with potential for generating releases such as March 2006 UF_6 release.
4/2006	Completed PCB containing paint removal from 13 breached fluorine cells and shipped off-site for reuse. These cells originated in C-410 and were stored in other facilities. They were returned from storage outside the C-410 Complex for decontamination.
8/2006	Initiated asbestos abatement in C-410 Complex, using glovebags.
9/2006	Removed an exterior ventilation stack that collapsed during severe weather.
9/2006	Completed installation of construction power and temporary lighting in Sectors 2 and 3 to support removal of asbestos, piping, and equipment.
3/2007	Completed first asbestos containment construction and initiated abatement using containments.
4/2007–12/2008	Continued removal of asbestos insulation, as well as removing utility piping and/or equipment to allow access to asbestos insulated piping. Also continued characterization and packaging loose materials for disposal.
12/2007	A secondary benefit of asbestos abatement and fixative application in the fluorine cell rooms on the eastern portion of the C-410 Complex (C-410 East Expansion) resulted in significant radiological decontamination. The area was downposted, allowing tours and inspections and nonintrusive work without respiratory protection.
1/2009	Initiated small diameter instrument line removal and stabilization of F2, HF, and H2 lines in Sector 4 (C-410 East Expansion).
2/2009	Completed accessible asbestos abatement; note that additional abatement would be required as UF_6 and other hazardous systems removed, making additional equipment and piping accessible. Approximately 43,600 linear ft of asbestos pipe abated to date, plus 6,500 ft^2 on tanks and large vessels.
4/2009	Shipped 3,200 gal of waste water from C-410 elevator pit to Clive, UT, for disposal.
4/2009	Paducah Site selected to receive ARRA funding to accelerate activity at C-410 Complex. Planning began to utilize funding from the ARRA to accelerate C-410 Removal Action and other projects at Paducah.
5/2009	Initiated revision of AM and RAWP to incorporate building demolition into current non-time-critical removal action.
5/2009	Initiated additional staff hiring and training to accelerate C-410 Removal Action using ARRA funding.
8/2009	Initiated prohibited item removal (mercury switches, capacitors, etc.) from components and equipment.
9/2009	Initiated HF Electrolyte System removal.
11/2009	EPA and KY approved AM Addendum to expand scope of action to include building demolition.
11/2009	Completed removal of HF electrolyte system.
1/2010	Initiated removal of vacuum system piping.
7/2010	UF_6 release occurs inside C-410 as the result of a failed “hot tap” installed to support purging a UF_6 process line.
10/2010	Completed placing flowable fill in C-411 and C-410 East Expansion in preparation for accelerated demolition.
11/2010	Expanded scope of action to include building demolition as result of KY and EPA approval of D2/R1 RAWP Addendum.
11/2010	Completed stabilization of HF and fluorine tanks on roof of C-411.
3/2011	Completed removal, packaging, and disposal of loose materials.
4/2011	Initiated demolition of C-411 (Cell Maintenance Building and C-410 Second East Expansion).
4/2011	Completed stabilization and removal of alcohol and ammonia systems.
5/2011	Experienced UF_6 release inside C-410 when personnel “nicked” a UF_6 process line with a saw; it overwhelmed the NAM.
6/2011	Completed demolition of C-411 and C-410 Second East Expansion.
7/2011	Completed removal of uranium powder system.

Table 4. Timeline of NTCRA for the C-410 Complex (Continued)

Date	Activity
8/2011	Completed slab decontamination and fixative application on Sector 4 and C-411 slabs.
9/2011	Completed deactivation and demolition of C-310-C-410 Tie line.
2/2012	Work suspended for removal of UF_6 piping put in place due to elevated plutonium contamination levels in the UF_6 piping near the UF_6 reactor towers.
3/2012	Lifted suspension on UF_6 piping removal following completion of additional training and work control changes to mitigate hazards for plutonium.
6/2012	Completed removal of UF_6 piping from C-410 Complex, including piping contaminated with plutonium.
8/2012	Completed UF_6 ash system stabilization.
9/2012	Initiated cutting and capping of cold traps in preparation for storage for asset recover.
11/2012	Completed HVAC system stabilization or removal.
2/2013	Completed installation of welded caps on all UF_6 Cold traps in preparation for storage.
5/2013	Completed placing all UF_6 cold traps in storage in C-746-Q Facility.
7/2013	Work paused when worker removing conduit with ACM containing wire mistakenly cut into energized line. Worker was not injured. Work paused on conduit removal to complete investigation and corrective actions.
8/2013	Resumed removal of electrical conduit following investigation and implementation of corrective actions.
12/2013	Completed systems removal in C-410 Complex.
12/2013	Continued performing paint chip removal, fixative application, temporary power removal, and rad surveys.
5/2014	Initiated C-410 First East Expansion demolition.
8/2014	Completed demolition of C-410 First East Expansion and C-410 Feed Plant.
9/2014	Determined large components (screw reactors) in C-420 containing internal asbestos should be abated prior to demo with the building. Construction of containment began. Transite removal paused to allow containment to be completed and abatement performed.
11/2014	Completed asbestos abatement of screw reactors.
11/2014	Initiated construction of a separation wall between pits in Zones 22 and 26 to allow storage of water in Zone 26 pit, and installation of flowable fill in Zone 22 pit.
1/2015	Completed installation of separation wall between Zones 22 and 26; pumped water to Zone 26 pit and cleaned Zone 22 Pit for flowable fill.
1/2015	Resumed transite removal.
3/2015	Completed demolition of the C-410 vent stacks.
5/2015	Completed demolition of the C-410 West Expansion (including C-410-I), C-410-C Limehouse, and C-420 Green Salt Plant.
5/2015	Completed demolition of C-420 (Green Salt Plant).
5/2015	Developed agreement for off-site decontamination of large equipment.
7/2015	Disposition of contaminated water collected from the basement of C-410 Complex at PGDP (Memorandum of Agreement).
10/2015	Treated and discharged contaminated water.
12/2015	Completed field work at the site of C-410 Complex.
1/2016	Completed shipment of building demolition debris.
3/2016	Decontaminated and returned large equipment to vendor.
4/2016	Final shipment of waste.

Summary of Any Operation and Maintenance Required

No further operation will be required; however, routine inspections and maintenance of the slab will be undertaken as necessary.

Summary of the Project Cost

The cost of implementing this removal action project, including packaging, transportation, and disposal of demolition debris, was $235,274,000. Table 5 summarizes the cost elements.

Table 5. Summary of Cost Elements

Activity	Cost, $M
Deactivation and Decommissioning, Demolition of Structure, Project Management, Slab Preparation and Sealing, Site Restoration, and Decontamination of Equipment On-site and Off-site	$222,264,000
Structural Waste Packaging, Transportation, and Disposal	$13,010,000
Total	**$235,274,000**

Laboratory Results Attached? [Yes] No

Comments/Reference Surveys/Released To (as applicable): Portions of Painted Pad (C-410/420 Foot print) was covered in a light water film where the water had "sweated" through the paint

Smears had to be dried prior to being sent to Tenelec for counting. For transferable contamintion readings and Tenelec instrument readings, see attached Tenelec sheets

Survey Points 41,47,48,53,54,69,70,and 75 to be Surveyed at a later date (Directs and smears)

Result Qualifier Codes

U	ALL ANALYSIS TYPES EXCEPT RADS: Not detected; RADS: Value reported is < MDA and/or TPU.
J	Estimated Quantitation
B	Compound found in blank as well as sample.
T	Tracer recovery is less than or equal to 30% or greater than or equal to 105%
X	Other specific flags or footnotes may be required to properly define the results.
H	Analysis performed outside holding time requirement.

Verification Codes

T	Holding time exceeded for this analysis

Validation Codes

=	Validated result, which is detected and unqualified
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
UJ	Analyte, compound or nuclide not detected above the reported detection limit, and the reported detection limit is approximated due to quality deficiency.
R	Result rejected by validator.
X	Not validated; Refer to the RSLTQUAL field for more information

Assessment Codes

R-C	Result questionable, credibility at issue.
J	Result estimated.
UJ	Not detected and result estimated.

Ms. April Webb
Acting Interim Federal Facility Agreement Manager
Division of Waste Management
Kentucky Department for Environmental Protection
200 Fair Oaks Lane, 2nd Floor
Frankfort, Kentucky 40601

Dear Mr. Richards and Ms. Webb:

DISPOSITION OF CONTAMINATED WATER COLLECTED FROM THE BASEMENT OF THE C-410 COMPLEX AT THE PADUCAH GASEOUS DIFFUSION PLANT

Reference: Letter from J. Corkran to J. Woodard, "EPA Revised Memorandum of Agreement Proposal-Disposition of Contaminated Water Collected from the Basement of the C-410 Complex at the Paducah Gaseous Diffusion Plant," dated July 8, 2015

The purpose of this letter is to document the U.S. Department of Energy (DOE) agreement with the U.S. Environmental Protection Agency (EPA) and the Commonwealth of Kentucky regarding the disposition of contaminated water collected in a basement of the C-410 Complex at the Paducah Site. DOE has agreed to treat the water prior to discharge and has elected to discharge the water directly to the internal plant ditches. DOE has attached the signed Memorandum of Agreement (MOA) to reflect this agreement and a map depicting the route the treated C-410 water will follow.

In an effort to bring the C-410 project to completion, DOE has agreed with the attached MOA even though it does not contain key elements that are important to DOE. First, the MOA does not recognize that DOE is taking this action voluntarily. Based on the DOE's calculations, discharge of the C-410 water without treatment does not present an imminent and substantial endangerment to public health or welfare or the environment. The proposed discharge is below the applicable or relevant and appropriate requirement approved for this project [10 *CFR* § 20.130(a)(1); 902 *KAR* 100.019 §10(1)]. In addition, discharge of the C-410 water without treatment would be within the acceptable Comprehensive Environmental Response, Compensation, and Liability Act risk range and would not exceed any other activity or dose-

based regulations or guidance for radionuclide releases.[1] As such, it is DOE's position that this action is being done voluntarily as a Best Management Practice.

Secondly, the MOA omits the FFA parties' understanding that no additional actions related to the removal, treatment, and disposition of the contaminated C-410 water will be required beyond activities addressed in the agreement. In the reference letter, EPA acknowledged that once the C-410 water is dispositioned, no scenario could be identified that would require additional action; as such, it is acceptable not to include the clause.

Lastly, EPA's revised proposal removed, from the draft MOA, the clause that requires EPA to provide the technical analysis (including calculations) that supports EPA's claim that DOE's original plan to discharge the collected water directly "...may present an imminent and substantial endangerment to public health or welfare or the environment." DOE has requested multiple times that EPA provide the basis for its determination that discharge of the C-410 water may present an imminent and substantial endangerment to human health or the environment. To date, EPA has not provided such information. In the reference letter, EPA stated that "the EPA Region 4 Paducah team is prepared to support an FFA Stop Work Order retrospective, outside of the C-410 MOA if requested/directed by EPA Region 4 Senior Managers, including a discussion of the FFA stop work language and a discussion of imminent and substantial endangerment technical analysis/calculations, to enhance three-party understanding." Given EPA's affirmative, written representation that such data/calculations exist, DOE will be sending a letter to EPA Region 4 Senior Managers. This letter will request EPA provide this information in writing and facilitate a meeting between the three parties.

If you have any questions or require additional information, please contact me at (270) 441-6820.

Sincerely,

Jennifer Woodard

Jennifer Woodard
Paducah Site Lead
Portsmouth/Paducah Project Office

Enclosures:
1. Signed Memorandum of Agreement (MOA)
2. Map C-410 Treated Water Discharge Route

[1] These standards include the 60,000 pCi/L effluent limit for technetium-99 (Tc-99) that EPA approved in the Paducah Gaseous Diffusion Plant Southwest Plume MOA and at the Maxey Flats Superfund Site in Kentucky, 902 *KAR* 100:019 (44) Table II; 10 *CFR* Part 20 Appendix B; the 12 mrem guidance that EPA recently issued, *Radiation Risk Assessment at CERCLA Sites: Q&A OSWER No. 9200.4-40*, May 2014; and DOE's Derived Concentration Standards for Tc-99 and uranium isotopes. In addition, the proposed discharge presents no threat to on-site workers.

Memorandum of Agreement
for Disposition of C-410 Basement Water at the Paducah Site

- The contaminated water in the C-410 Building basement (Zone 26) at the Paducah Gaseous Diffusion Plant (PGDP) will be removed by the U.S. Department of Energy (DOE) (i.e., pumped out) and treated *ex situ* at Zone 26 using proven ion exchange technology with resins capable of treating the radionuclides [i.e., technetium-99 (Tc-99) and uranium] detected in the water. The ion exchange technology will use standard industry design (off the shelf), but the system may include more than one unit that will be stacked (or run in sequence) to treat radionuclides.

- The ion exchange treatment system will be designed (based on manufacturer specifications) to achieve between 93%–98% reduction in the radionuclides detected in the contaminated water. Verification of treatment efficiency will occur at each interval in the process as explained below.

- Verification of treatment efficiency requires definition of constituent-specific baseline values. The constituent-specific baseline value for Tc-99 and uranium will be calculated as follows:

    - An in-line sampling port will be utilized to pull three samples from the first 3,000 gallons (gal) of contaminated water as it enters into the ion exchange treatment system. The three samples will be averaged to provide the constituent-specific baseline value. Radiological samples will be 3 liters of water. Samples will be collected at five minutes after treatment begins, approximately half-way through the treatment run, and within five minutes of the predicted end of the treatment run. This process will be repeated at the beginning of each interval (i.e., 0 gal, 60,000 gal, and 120,000 gal). Samples will be analyzed for Tc-99 (pCi/L) and uranium (mg/L). The data will be provided two weeks after sample collection, and the results will be shared with the Federal Facility Agreement (FFA) parties, with a follow-up meeting scheduled to discuss the results and agree on the constituent-specific baseline values (Record of Conversation, March 9, 2015). The FFA parties will make themselves readily available within 3-5 days of data receipt for the follow-up meeting.

- The first 3,000 gals of contaminated water will be treated and collected in an aboveground temporary storage tank. The treated water will be sampled at the discharge port after treatment (n=3 samples) for Tc-99 (pCi/L) and uranium (mg/L). Three samples will be averaged to create the post-treatment value for each interval (e.g., 3,000 gal, 60,000 gal, and 120,000 gal). Each sample will be 3 liters of water. DOE will receive the sampling results within two weeks of sample collection and immediately share the results with the U.S. Environmental Protection Agency (EPA) and the Kentucky Department for Environmental Protection (KDEP). No water will be discharged during that time. The FFA parties will evaluate the contaminant concentrations in the treated water and verify that treatment efficiencies are in the range of 93%–98% reduction, relative to the constituent-specific baseline.

- This verification process (through sampling a batch of treated water to verify treatment efficiencies) will be repeated after approximately 60,000 gal of the water (one-third of the water) has been treated and dispositioned and again after 120,000 gal of water (two-thirds of the water) has been treated and dispositioned. At each batch sampling interval, if constituent-specific treatment efficiency has been met for Tc-99 and uranium, DOE will disposition the treated water as explained below. The FFA parties fully expect that treatment of the contaminated waters using Best Available Technology and new ion exchange units will yield the targeted contaminant reduction efficiencies. If the constituent-specific treatment efficiencies are not met at any verification interval, then treatment and dispositioning of the C-410 basement water will stop, and the FFA parties will reconvene and decide what additional actions may be necessary to achieve the targeted treatment efficiency.

- Each batch of treated water will be discharged directly from the treatment system into the internal plant ditch system, provided that fresh Apatite material is placed in the unlined portions of the ditch system (as currently in the field–"checkdams" along the ditch) between the treatment system and the first lift station (C-400-L) to further capture and remove residual uranium and ultimately will be discharged from the C-616-F Lagoon through Outfall 001. Outfall 001 discharges to Bayou Creek.

- DOE will characterize the nature and extent of soil/sediment and surface water contamination in the future, as part of another Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) operable unit (e.g., the Surface Water Operable Unit or the Soils Operable Unit), in view of EPA and DOE selecting a final remedy for the unit (including the ditches) as summarized in the Site Management Plan.

- Once the contaminated water is removed from the C-410 basement and successfully treated, any residual solids (e.g., supernatant or sludge) in the bottom of Zone 26 will be characterized, managed, and disposed of in accordance with the action-specific applicable or relevant and appropriate regulation/requirements and TBC included in Appendix C, Table C.3, of the approved *Engineering Evaluation/Cost Analysis for C-410 Complex Infrastructure at the Paducah Gaseous Diffusion Plant*, DOE/OR/07-1952&D2/R1. This waste shall be disposed on-site at the permitted C-746-U Landfill or transported and disposed at an approved off-site waste disposal facility.

- DOE is moving forward with the action presented herein as part of the CERCLA Non-Time Critical Removal Action (*Action Memorandum Addendum for C-410 Infrastructure Removal at the Paducah Gaseous Diffusion Plant, Paducah, Kentucky*, DOE/LX/07-0273&D2, November 2009) recognizing that it addresses the concerns EPA raised in their November 26, 2014, letter.

- The conduct of this action does not establish or imply an effluent limit for radionuclide(s) discharge into the surface water at Outfall 001, nor does it establish any precedent, level, or

threshold that requires treatment for other discharges of radionuclides into surface water at PGDP as part of a CERCLA response action.

- The approved CERCLA documents for this project (e.g., Action Memorandum, Removal Action Work Plan) do not require modification to implement the aforementioned actions. A copy of the signed Memorandum of Agreement that incorporates this proposal, including the Attachments, will be incorporated into the C-410 Decontamination and Decommissioning Removal Action Report.

- The treatment system, aboveground storage tank, and associated connections/fittings will be maintained and monitored throughout the period of operation to ensure that there are no releases that could present risk to human health and/or the environment.

- DOE will notify EPA and KDEP once the field work begins (such as mobilization of treatment unit) and prior to initiating the pumping of the contaminated water from Zone 26 of the C–410 Basement. DOE will initiate the field work within 120 calendar days from date of the effective date of the signed Agreement.

Attachment 1: Map of C-410 treated water disposition route (including relevant description of details).

Concurrence:

DOE, EPA, and KDEP, as parties to the Paducah Federal Facility Agreement, hereby agree with the proposed action. EPA and KDEP authorize DOE to proceed with treatment and disposition of the contaminated C-410 water, as proposed.
