ATTACHMENT D1

RESIDENTIAL NO ACTION LEVEL SCREENING VALUES

THIS PAGE INTENTIONALLY LEFT BLANK

D1. RESIDENTIAL NO ACTION LEVEL SCREENING VALUES

The Risk Methods Document (RMD) (DOE 2011) identified those constituents considered potential chemicals of potential concern (COPCs) at the Paducah Gaseous Diffusion Plant (PGDP) and tabulated their no action levels (NALs). Several constituents were detected in samples evaluated for the Soils Operable Unit (OU) Remedial Investigation for which there were no tabulated child residential NALs in Table A.4 of the RMD. This residential NAL is used in the risk assessment for identification of potential COPCs; therefore, it was necessary to develop child resident NALs consistent with the approach documented in the RMD to identify COPCs in the risk assessment. These constituents are listed in Table D1.1.

Table D1.1. Soils OU Constituents with No Published PGDP Tabulated Residential NALs

Metals	
Lithium	
Organics	
1,1,1-Trichloroethane	Bis(2-ethylhexyl)phthalate
1,1,2-Trichloroethane	Bromomethane
1,1-Dichloroethane	Butyl benzyl phthalate
1,2,4-Trichlorobenzene	Carbon disulfide
1,2-Dichlorobenzene	Chlorobenzene
1,2-Dichloroethane	Dibenzofuran
1,3-Dichlorobenzene	Dibromochloromethane
1,4-Dichlorobenzene	Diethyl phthalate
2,4-Dimethylphenol	Dimethyl phthalate
2,4-Dinitrotoluene	Di-n-butyl phthalate
2,6-Dinitrotoluene	Di-n-octylphthalate
2-Butanone	m,p-Cresol
2-Hexanone	Methylene chloride
2-Methylnaphthalene	N-Nitrosodiphenylamine
2-Methylphenol	Pentachlorophenol
4-Methyl-2-pentanone	Phenanthrene
Acenaphthylene	Phenol
Acetone	Styrene
Benzenemethanol	Toluene
Benzo(ghi)perylene	Vinyl acetate
Benzoic acid	
Radionuclides	
Cesium-134	
Thorium-228	
Thorium-232	

Available toxicity values for these constituents are listed in Table D1.2. The derived cancer and noncancer NALs used as residential screening values to identify COPCs are presented in Table D1.3. Consistent with the RMD, the noncancer NAL is based on the child resident and the NAL for carcinogens is based on the aggregate resident (30-year exposure). This table also provides the maximum detected concentration in surface and subsurface soil samples.

Table D1.2. Toxicity Values and Information Used in PRG Derivation

Chemical Abstract Number	Analyte	GI Absorption Factor (Unitless)	Oral RfD (RfDo)	Absorbed Dose (RfDd)	Inhalation (RfCi)	Inhalation (RfDi)

191242	Benzo(ghi)perylene				28	mg/kg
85018	Phenanthrene				64	mg/kg
131113	Dimethyl phthalate					mg/kg

n/a = no toxicity value available

Bold indicates the analyte was added as a COPC to the Soils OU risk assessment.

The NALs above were used to identify COPCs in surface and subsurface soils in Tables D.4 and D.5 Table D1.3 also includes the maximum detected concentration in soils (surface and subsurface). Only two chemicals (pentachlorophenol and bis-2-ethylhexyl phthalate) were detected above the residential NAL, and this occurred only for one location for each chemical. This is consistent with the RMD, supporting that the tabulated NALs are constituents of primary interest for evaluating risks at PGDP.

The constituents shown in the list below were detected in Soils OU soils, but have no toxicity values for which to determine screening values.

- Noncarcinogenic polycyclic aromatic hydrocarbons (PAHs)
  - Phenanthrene
  - Benzo(ghi)perylene
  - Acenaphthylene
- 1,3-Dichlorobenzene

Three PAHs detected in samples for which there are no toxicity criteria. Similar to anthracene and pyrene, these are not classifiable as to their carcinogenicity to humans. Although no specific reference doses have been provided by the U.S. Environmental Protection Agency (EPA) for these, frequently they are screened based on values derived for pyrene or other noncarcinogenic PAHs. Kentucky Division of Waste Management Superfund Branch, Petroleum Cleanup Section has provided soil action levels [hazard index (HI = 1)] of 3,400 mg/kg for acenaphthylene and phenanthrene consistent with the EPA Regional Screening Level (RSL) for acenaphthene, and 1,700 mg/kg for benzo(ghi)perylene based on the RSL for pyrene.[1]

The potential uncertainty in the risk assessment for not incorporating hazard quotients for these PAHs was evaluated based on comparing detected concentrations with the PGDP child resident NAL for pyrene of 81.2 mg/kg. This is lower than NALs for noncancer endpoints for other PAHs (e.g. acenaphthylene child resident NAL is 117 mg/kg). The overall patterns in the data also were considered. This review indicated the following:

- None of the concentrations of acenaphthylene, benzo(ghi)perylene, or acenapthylene exceeded the child resident NAL for pyrene of 81.2 mg/kg, so none would have been identified as a COPC for further evaluation.
- The highest concentrations of these PAHs were reported in Solid Waste Management Unit 518 Exposure Unit 1. Other PAHs at this location showed pyrene above the NAL at a concentration of 150 mg/kg and, more importantly, carcinogenic PAHs over 100 mg/kg. These levels clearly identify issues to be further considered for PAHs.

Dichlorobenzenes (DCB). According to Agency for Toxic Substances and Disease Registry, "Very little is known about the health effects of 1,3- dichlorobenzene, especially in humans, but they are likely to be similar to those of 1,2- and 1,4-dichlorobenzene."[2] The child resident NALs for 1,2-DCB is 29.2 mg/kg and for 1,4-DCB is 0.813 mg/kg, both significantly higher than the maximum reported concentration of 1,3-DCB of 0.0028 mg/kg. In addition, it was infrequently reported. These things suggest this compound would not be a COPC or impact the results of the risk assessment.

D2. EPC UNCERTAINTY EVALUATION

Calculation of exposure point concentrations (EPCs) for the Soils Operable Unit (OU) included assignment of the average chemical of potential concern (COPC) concentration to grids within an exposure unit (EU) of a solid waste management unit (SWMU) or area of concern (AOC) for which data were not available in order to fill the empty cell. This process has the potential for introducing an uncertainty into those calculations where there are many empty cells. The uncertainties associated with these calculations are discussed below.

For EUs with 10 or more grids, the EPC was calculated using the grid values to determine the 95% upper confidence limit on the mean concentration (UCL 95). The 89 SWMU/EU combinations for which the uncertainty associated with this process applies are listed in Table D2.1.

Using the average concentration for empty cells can impact the EPC estimate, depending on the number of actual results and concentration distributions. If fewer than 10 results are available, the maximum concentration was used as the EPC, and this factor was considered in determining uncertainties. The following are general observations made when reviewing the results for the future industrial worker:

- Many EUs/parameters had values for all or most grids; thus, the UCL 95 is considered the best estimate of the EPC.

- Many contaminants that have significant differences in the EPC and maximum concentrations, however, make no significant contribution to the cumulative excess lifetime cancer risk (ELCR) or hazard index (HI) and/or are not chemicals of concern (COCs).

The grid averaging process described above has the potential to underestimate an EPC compared with one calculated using other protocols. Depending on the data set, this may be a UCL 95 calculated with fewer analytical values or the maximum concentration. By assuming the maximum concentration for each constituent instead of a calculated concentration, a higher ELCR or HI result is obtained. The cumulative ELCR and HI for each EU is used for the initial screening of the results to understand the uncertainty, prior to a more in depth review of the underlying data.

D2.1. EPC UNCERTAINTY FOR THE EU HAZARD INDEX

The HIs for the future industrial worker calculated using the grid based EPCs (HI-EPC) are compared to the HI calculated assuming each COPC was present at its maximum detected concentration (HI Max) (Table D2.2). These HIs are calculated using the current approach in the Risk Methods Document, and do not consider the additional uncertainties as discussed in Section D.6 for metals (DOE 2011).

There was little difference in the impacts on the decision-making process based upon the different methodology. The HIs differed generally by less than a factor of 2, with no difference at all for 13 of these pairs of estimates. Irrespective of the method of calculation, there is no impact on the decision process when both HI estimates are below the benchmark value of 1. Forty-nine of the 89 EUs had HIs < 1 using both estimates of the exposure concentration. For an additional 36 EUs, the HIs were greater than 1 for both methods.

There were three EUs where the HI calculated using the maximum concentration was greater than 1; whereas, the HI using the grid based EPC was below 1. For two of these (SWMU 14/EU 1 and SWMU 520/ EU 3), each grid had a value; thus, the UCL 95 is an appropriate methodology with which to estimate the average.

For SWMU 227/EU 1, the HI was 1.9 using the maximum concentrations and 0.6 using the EPC. This difference is attributed primarily to nickel, which had a maximum concentration of 653 mg/kg, well below the U.S. Environmental Protection Agency's Regional Screening Level of 2,000 mg/kg (HI of 0.1) for the industrial worker and would not be a COC if evaluated consistent with these screening values (EPA 2012). Therefore, it is clear that other uncertainties are critical in the interpretation of the uncertainties for noncancer hazards. This is also clear for the EUs with HI values greater than 20, where vanadium represents most of the HI, with a maximum concentration that would eliminate it as a COC using current toxicity assumptions.

The COCs identified based upon the noncancer hazards were primarily metals, and there were 10 or more results included in the calculations for over 70% of the constituents/EUs. In all cases where an individual metal had a concentration resulting in an HI > 1, there were greater than 10 results; thus, averages were

infrequently used to fill data gaps. For this reason, the EPCs, calculated using the maximums as shown on Table D2.2, likely overestimate the EPCs.

D2.2. EPC UNCERTAINTIES FOR THE ELCR

The cumulative grid based ELCR (ELCR-EPC) for the future industrial worker at each EU is compared on Table D2.3 to the estimated risk assuming each COPC was present at its maximum concentration (ELCR Max). In some cases, these values were identical; however, the ELCR-Max was typically less than a factor of 2 higher than the ELCR-EPC.

Table D2.3. Comparison of ELCR for RME Calculations Based on the EPC as compared to Maximum Concentrations

567	3	1.3E-06	1.3E-06
567	4	1.5E-06	1.2E-06

There were 3 EUs where the ELCR-Max was more than 3 times higher than the ELCR-EPC. These EUs were AOC 541/EU1, SWMU 561/EU1, and SWMU 561/EU2. The ELCR calculated using both methods exceeded 1E-4; thus, the ELCR calculation method did not affect the final conclusion. More importantly, the COCs that represent 80–90% of the total risk (see Table D2.4) have a minimum of 14 results; thus, the ELCR-EPC is assumed to provide an accurate measure of the reasonable maximum exposure (RME).

There are instances where fewer than 10 grids had values to be used in the calculation of the UCL 95; however, in many of these cases, the EPCs were frequently at or near the maximum concentration and/or the contribution to the cumulative ELCR was not significant. The overall impact of the variation in calculation is incorporated into differences in the ELCRs as shown on Table D2.3.

Table D2.4. Risk Drivers for SWMUs with ELCR Uncertainty Greater than a Factor of 3

SWMU	EU	COPC	Units	Number Results	Number Grids	Max	EPC	ELCR Max	ELCR EPC

561	2	PCB, Total	mg/kg	27	31	79	16.4	4.2E-04	8.7E-05
561	2	Total PAH	mg/kg	14	31	9.83	2.43	1.7E-04	4.1E-05

There are instances where fewer than 10 grids had values to be used in the calculation of the UCL 95; however, in many of these cases, the EPCs were frequently at or near the maximum concentration and/or the contribution to the cumulative ELCR was not significant. The overall impact of the variation in calculation is incorporated into differences in the ELCRs as shown on Table D2.3.

D2.3. CONCLUSIONS

The EPCs calculated consistent with the approach in the work plan are reasonable estimates of the RME for surface soils. The differences in the HI/ELCR using the maximum concentration as compared to the grid-based approach, as shown on Tables D2.2 and D2.3, typically are less than a factor of 2. The HI/ELCR results appear to yield accurate estimates of the RME. The use of the maximum concentrations will give somewhat higher values; however, in areas where more than 10 results were available, the EPC was often near or equal to the maximum.

The HIs generally were low except in cases where the uncertainties associated with the dermal absorption assumptions were a significant factor in the identification of COCs and the estimate of the RME concentration.

Cesium-137

General Statistics

Number of Valid Observations	14	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.125	Minimum of Log Data	-2.079
Maximum	0.753	Maximum of Log Data	-0.284
Mean	0.527	Mean of log Data	-0.698
Median	0.527	SD of log Data	0.415
SD	0.137		
Coefficient of Variation	0.26		
Skewness	-1.676		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Uranium-238

General Statistics

Number of Valid Observations	14	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.894	Minimum of Log Data	-0.112
Maximum	3.31	Maximum of Log Data	1.197
Mean	1.718	Mean of log Data	0.499
Median	1.718	SD of log Data	0.302
SD	0.541		
Coefficient of Variation	0.315		
Skewness	1.714		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

95% Approximate Gamma UCL	1242		
95% Adjusted Gamma UCL	1639		

Potential UCL to Use	Use 95% Hall's Bootstrap UCL	2470

Recommended UCL exceeds the maximum observation

In Case Bootstrap t and/or Hall's Bootstrap yields an unreasonably large UCL value, use 97.5% or 99% Chebyshev (Mean, Sd) UCL

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

Antimony

General Statistics

Number of Valid Observations	12	Number of Distinct Observations	3

Raw Statistics		Log-transformed Statistics	
Minimum	0.23	Minimum of Log Data	-1.471
Maximum	0.784	Maximum of Log Data	-0.243
Mean	0.299	Mean of log Data	-1.28
Median	0.23	SD of log Data	0.35
SD	0.156		
Coefficient of Variation	0.523		
Skewness	3.191		

Warning: There are only 3 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Median	0.017	SD of log Data	1.119
SD	0.106		
Coefficient of Variation	1.395		
Skewness	2.282		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

PCB, Total

General Statistics

Number of Valid Observations	9	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.017	Minimum of Log Data	-4.08
Maximum	0.27	Maximum of Log Data	-1.31
Mean	0.074	Mean of log Data	-3.17
Median	0.017	SD of log Data	1.123
SD	0.086		
Coefficient of Variation	1.154		
Skewness	1.713		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

General Statistics

Number of Valid Observations	9	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.088	Minimum of Log Data	-2.44
Maximum	0.33	Maximum of Log Data	-1.11
Mean	0.262	Mean of log Data	-1.44
Median	0.33	SD of log Data	0.54
SD	0.1		
Coefficient of Variation	0.382		
Skewness	-1.31		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

General Statistics

Number of Valid Observations	14	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	1.73	Minimum of Log Data	0.548
Maximum	65	Maximum of Log Data	4.174
Mean	29.18	Mean of log Data	3.205
Median	29.18	SD of log Data	0.801
SD	12.73		
Coefficient of Variation	0.436		
Skewness	1.075		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Uranium-238

General Statistics

Number of Valid Observations	12	Number of Distinct Observations	1

Warning: There is only one distinct observation value in this data set - resulting in '0' variance!
ProUCL (or any other software) should not be used on such a data set!
The data set for variable Uranium-238 was not processed!

If possible, compute and collect Data Quality Objectives (DQOs) based sample size and analytical results.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Cobalt-60

General Statistics

Number of Valid Observations	16	Number of Distinct Observations	3

Raw Statistics		Log-transformed Statistics
Minimum	-0.00983	Log Statistics Not Avaliable
Maximum	0.0212	
Mean	0.00569	
Median	0.00569	
SD	0.00567	
Coefficient of Variation	9.97E-01	
Skewness	5.32E-16	

Warning: There are only 3 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Relevant UCL Statistics

Thallium

General Statistics

Number of Valid Observations	19	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.25	Minimum of Log Data	-1.386
Maximum	0.64	Maximum of Log Data	-0.446
Mean	0.353	Mean of log Data	-1.061
Median	0.353	SD of log Data	0.19
SD	0.0783		
Coefficient of Variation	0.222		
Skewness	2.733		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

General Statistics

Number of Valid Observations	13	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.4	Minimum of Log Data	-0.916
Maximum	0.97	Maximum of Log Data	-0.0305
Mean	0.593	Mean of log Data	-0.543
Median	0.593	SD of log Data	0.21
SD	0.133		
Coefficient of Variation	0.224		
Skewness	1.67		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Uranium-238

General Statistics

Number of Valid Observations	17	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.8	Minimum of Log Data	-0.223
Maximum	1.31	Maximum of Log Data	0.27
Mean	1.12	Mean of log Data	0.109
Median	1.12	SD of log Data	0.0967
SD	0.0986		
Coefficient of Variation	0.088		
Skewness	-1.755		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Uranium-238

General Statistics

Number of Valid Observations	20	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.83	Minimum of Log Data	-0.186
Maximum	1.38	Maximum of Log Data	0.322
Mean	1.077	Mean of log Data	0.0706
Median	1.077	SD of log Data	0.0834
SD	0.0906		
Coefficient of Variation	0.0842		
Skewness	0.999		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Cesium-137

General Statistics

Number of Valid Observations	12	Number of Distinct Observations	1

Warning: There is only one distinct observation value in this data set - resulting in '0' variance!
ProUCL (or any other software) should not be used on such a data set!
The data set for variable Cesium-137 was not processed!

If possible, compute and collect Data Quality Objectives (DQOs) based sample size and analytical results.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

	or 95% H-UCL	62.14

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

Number of Valid Observations	12	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.394	Minimum of Log Data	-0.931
Maximum	0.891	Maximum of Log Data	-0.115
Mean	0.652	Mean of log Data	-0.442
Median	0.652	SD of log Data	0.178
SD	0.106		
Coefficient of Variation	0.163		
Skewness	-0.303		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Mean	0.0495	Mean of log Data	-3.089
Median	0.0495	SD of log Data	0.517
SD	0.0158		
Coefficient of Variation	0.319		
Skewness	-3.11E-15		

Warning: There are only 3 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Potential UCL to Use		
	Use 95% Student's-t UCL	60.93
	or 95% Modified-t UCL	61.17
	or 95% H-UCL	61.97

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

Cadmium

General Statistics

Number of Valid Observations	12	Number of Distinct Observations	3

Raw Statistics		Log-transformed Statistics	
Minimum	0.053	Minimum of Log Data	-2.937
Maximum	8.55	Maximum of Log Data	2.146
Mean	4.302	Mean of log Data	1.15
Median	4.302	SD of log Data	1.302
SD	1.812		
Coefficient of Variation	0.421		
Skewness	-2.61E-15		

Warning: There are only 3 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Cesium-137

General Statistics

Number of Valid Observations	12	Number of Distinct Observations	1

Warning: There is only one distinct observation value in this data set - resulting in '0' variance!
ProUCL (or any other software) should not be used on such a data set!
The data set for variable Cesium-137 was not processed!

If possible, compute and collect Data Quality Objectives (DQOs) based sample size and analytical results.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Mercury

General Statistics

Number of Valid Observations	12	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.0236	Minimum of Log Data	-3.747
Maximum	10	Maximum of Log Data	2.303
Mean	8.889	Mean of log Data	1.767
Median	10	SD of log Data	1.738
SD	2.876		
Coefficient of Variation	0.324		
Skewness	-3.144		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

Potential UCL to Use		Use 95% H-UCL	989.6

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

Warning: There are only 3 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Vanadium

General Statistics

Number of Valid Observations	12	Number of Distinct Observations	3

Raw Statistics		Log-transformed Statistics	
Minimum	35.2	Minimum of Log Data	3.561
Maximum	40.6	Maximum of Log Data	3.704
Mean	37.9	Mean of log Data	3.635
Median	37.9	SD of log Data	0.0304
SD	1.151		
Coefficient of Variation	0.0304		
Skewness	1.09E-14		

Warning: There are only 3 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

Silver

General Statistics

Number of Valid Observations	13	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.06	Minimum of Log Data	-2.813
Maximum	13.91	Maximum of Log Data	2.633
Mean	9.452	Mean of log Data	1.926
Median	10	SD of log Data	1.427
SD	3.038		
Coefficient of Variation	0.321		
Skewness	-2.592		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

General Statistics

Number of Valid Observations	12	Number of Distinct Observations	3

Raw Statistics		Log-transformed Statistics	
Minimum	0.084	Minimum of Log Data	-2.477
Maximum	5	Maximum of Log Data	1.609
Mean	4.508	Mean of log Data	1.252
Median	5	SD of log Data	1.175
SD	1.406		
Coefficient of Variation	0.312		
Skewness	-3.356		

Warning: There are only 3 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

Mercury

General Statistics

Number of Valid Observations	13	Number of Distinct Observations	3

Raw Statistics		Log-transformed Statistics	
Minimum	0.0491	Minimum of Log Data	-3.014
Maximum	10	Maximum of Log Data	2.303
Mean	9.091	Mean of log Data	1.878
Median	10	SD of log Data	1.471
SD	2.765		
Coefficient of Variation	0.304		
Skewness	-3.41		

Warning: There are only 3 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

or 95% H-UCL	61.47

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

	or 95% H-UCL	64.47

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

95% Approximate Gamma UCL	865.4		
95% Adjusted Gamma UCL	941.3		

Potential UCL to Use	Use 95% H-UCL	995.7

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

Vanadium

General Statistics

Number of Valid Observations	12	Number of Distinct Observations	1

Warning: There is only one distinct observation value in this data set - resulting in '0' variance!
ProUCL (or any other software) should not be used on such a data set!
The data set for variable Vanadium was not processed!

If possible, compute and collect Data Quality Objectives (DQOs) based sample size and analytical results.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Mercury

General Statistics

Number of Valid Observations	13	Number of Distinct Observations	3

Raw Statistics		Log-transformed Statistics	
Minimum	8.8	Minimum of Log Data	2.175
Maximum	10	Maximum of Log Data	2.303
Mean	9.88	Mean of log Data	2.29
Median	10	SD of log Data	0.035
SD	0.329		
Coefficient of Variation	0.0333		
Skewness	-3.452		

Warning: There are only 3 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Recommended UCL exceeds the maximum observation			

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)

and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.
Total PAH

General Statistics

Number of Valid Observations	30	Number of Distinct Observations	1

Warning: There is only one distinct observation value in this data set - resulting in '0' variance!
ProUCL (or any other software) should not be used on such a data set!
The data set for variable Total PAH was not processed!

If possible, compute and collect Data Quality Objectives (DQOs) based sample size and analytical results.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Uranium-238

General Statistics

Number of Valid Observations	13	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.92	Minimum of Log Data	-0.083
Maximum	1.27	Maximum of Log Data	0.239
Mean	1.057	Mean of log Data	0.0528
Median	1.057	SD of log Data	0.0699
SD	0.0764		
Coefficient of Variation	0.0723		
Skewness	1.48		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Cobalt

General Statistics

Number of Valid Observations	13	Number of Distinct Observations	3

Raw Statistics		Log-transformed Statistics	
Minimum	11.4	Minimum of Log Data	2.434
Maximum	25	Maximum of Log Data	3.219
Mean	18.2	Mean of log Data	2.89
Median	18.2	SD of log Data	0.163
SD	2.776		
Coefficient of Variation	0.153		
Skewness	5.76E-15		

Warning: There are only 3 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Total PAH

General Statistics

Number of Valid Observations	17	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.01	Minimum of Log Data	-4.636
Maximum	0.737	Maximum of Log Data	-0.306
Mean	0.369	Mean of log Data	-1.172
Median	0.369	SD of log Data	0.908
SD	0.129		
Coefficient of Variation	0.349		
Skewness	0.117		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

PCB, Total

General Statistics

Number of Valid Observations	17	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.32	Minimum of Log Data	-1.139
Maximum	5	Maximum of Log Data	1.609
Mean	4.082	Mean of log Data	1.229
Median	4.082	SD of log Data	0.817
SD	1.452		
Coefficient of Variation	0.356		
Skewness	-2.153		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Cobalt-60

General Statistics

Number of Valid Observations	37	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics
Minimum	-0.0318	Log Statistics Not Avaliable
Maximum	1.53E-02	
Mean	-0.00478	
Median	-0.00478	
SD	0.00573	
Coefficient of Variation	-1.198	
Skewness	-1.763	

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Cobalt-60

General Statistics

Number of Valid Observations	37	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics
Minimum	-0.0318	Log Statistics Not Avaliable
Maximum	0.0153	
Mean	-0.00478	
Median	-0.00478	
SD	0.00573	
Coefficient of Variation	-1.198	
Skewness	-1.763	

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

General Statistics

Number of Valid Observations	36	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	6260	Minimum of Log Data	8.742
Maximum	13000	Maximum of Log Data	9.473
Mean	8156	Mean of log Data	9.002
Median	8088	SD of log Data	0.0921
SD	889.6		
Coefficient of Variation	0.109		
Skewness	4.576		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Pentachlorophenol

General Statistics

Number of Valid Observations	36	Number of Distinct Observations	3
Number of Missing Values	1		

Raw Statistics		Log-transformed Statistics	
Minimum	1.7	Minimum of Log Data	0.531
Maximum	2.1	Maximum of Log Data	0.742
Mean	1.963	Mean of log Data	0.674
Median	1.967	SD of log Data	0.0269
SD	0.0503		
Coefficient of Variation	0.0256		
Skewness	-3.72		

Warning: There are only 3 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Antimony

General Statistics

Number of Valid Observations	36	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	2.2	Minimum of Log Data	0.788
Maximum	10	Maximum of Log Data	2.303
Mean	8.274	Mean of log Data	2.096
Median	8.36	SD of log Data	0.228
SD	1.101		
Coefficient of Variation	0.133		
Skewness	-4.88		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

95% Adjusted Gamma UCL	5.741		

Potential UCL to Use	Use 95% H-UCL	8.268

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

Plutonium-239/240

General Statistics

Number of Valid Observations	36	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.00963	Minimum of Log Data	-4.643
Maximum	7.78	Maximum of Log Data	2.052
Mean	2.045	Mean of log Data	0.547
Median	1.964	SD of log Data	0.926
SD	1.046		
Coefficient of Variation	0.512		
Skewness	4.729		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Raw Statistics		Log-transformed Statistics	
Minimum	0.0072	Minimum of Log Data	-4.934
Maximum	0.478	Maximum of Log Data	-0.737
Mean	0.301	Mean of log Data	-1.322
Median	0.301	SD of log Data	0.778
SD	0.0756		
Coefficient of Variation	0.251		
Skewness	-2.006		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Total PAH

General Statistics

Number of Valid Observations	27	Number of Distinct Observations	1

Warning: There is only one distinct observation value in this data set - resulting in '0' variance!
ProUCL (or any other software) should not be used on such a data set!
The data set for variable Total PAH was not processed!

If possible, compute and collect Data Quality Objectives (DQOs) based sample size and analytical results.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Beryllium

General Statistics

Number of Valid Observations	17	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.22	Minimum of Log Data	-1.514
Maximum	0.7	Maximum of Log Data	-0.357
Mean	0.467	Mean of log Data	-0.781
Median	0.467	SD of log Data	0.213
SD	0.085		
Coefficient of Variation	0.182		
Skewness	-0.27		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Silver

General Statistics

Number of Valid Observations	17	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.043	Minimum of Log Data	-3.147
Maximum	11.4	Maximum of Log Data	2.434
Mean	9.521	Mean of log Data	1.992
Median	10	SD of log Data	1.325
SD	2.467		
Coefficient of Variation	0.259		
Skewness	-3.98		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Potential UCL to Use		Use 95% H-UCL	708.9

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
These recommendations are based upon the results of the simulation studies summarized in Singh, Singh, and Iaci (2002)
and Singh and Singh (2003). For additional insight, the user may want to consult a statistician.

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

General Statistics

Number of Valid Observations	10	Number of Distinct Observations	4

Raw Statistics		Log-transformed Statistics	
Minimum	0.11	Minimum of Log Data	-2.207
Maximum	0.42	Maximum of Log Data	-0.868
Mean	0.257	Mean of log Data	-1.402
Median	0.257	SD of log Data	0.324
SD	0.0734		
Coefficient of Variation	0.286		
Skewness	0.421		

Warning: There are only 4 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Total PAH

General Statistics

Number of Valid Observations	11	Number of Distinct Observations	3

Raw Statistics		Log-transformed Statistics	
Minimum	0.0042	Minimum of Log Data	-5.473
Maximum	0.0406	Maximum of Log Data	-3.204
Mean	0.0224	Mean of log Data	-3.897
Median	0.0224	SD of log Data	0.552
SD	0.00814		
Coefficient of Variation	0.363		
Skewness	0		

Warning: There are only 3 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.

Cesium-137

General Statistics

Number of Valid Observations	10	Number of Distinct Observations	1

Warning: There is only one distinct observation value in this data set - resulting in '0' variance!
ProUCL (or any other software) should not be used on such a data set!
The data set for variable Cesium-137 was not processed!

If possible, compute and collect Data Quality Objectives (DQOs) based sample size and analytical results.
The Project Team may decide to use alternative site specific values to estimate environmental parameters (e.g., EPC, BTV).

Silver

General Statistics

Number of Valid Observations	12	Number of Distinct Observations	3

Raw Statistics		Log-transformed Statistics	
Minimum	0.033	Minimum of Log Data	-3.411
Maximum	10	Maximum of Log Data	2.303
Mean	9.045	Mean of log Data	1.813
Median	10	SD of log Data	1.646
SD	2.87		
Coefficient of Variation	0.317		
Skewness	-3.337		

Warning: There are only 3 Distinct Values in this data
There are insufficient Distinct Values to perform some GOF tests and bootstrap methods.
Those methods will return a 'N/A' value on your output display!

It is necessary to have 4 or more Distinct Values to compute bootstrap methods.
However, results obtained using 4 to 9 distinct values may not be reliable.
It is recommended to have 10-15 or more observations for accurate and meaningful bootstrap results.
